FOREWORD

Before embarking on the subject matter proper, I feel it absolutely necessary and at the same time obligatory on my part to express my respect and gratitude to those scholars. and my well-wishers without whose advice and encouragement at every step it would not have been possible for me to bring my humble venture into light. This, I think, is imperative on me as they are inseparably connected with this thesis. With deep reverence, I first acknowledge my debts to Dr. Gourinath Sastri under whose supervision this work has been done and submitted. In this connection respectful acknowledgement is due also to Dr. Kalikumar Dutta Sastri, who not only initiated me in this most interesting but least cultivated subject but helped me with his active guidance which adds qualitative nicety to my work. He was also kind enough to devote his valuable time and energy to go through the entire work and to express expert's comments on doubtful and vexing questions as and when required. With both of them I feel a strong bond of indebtedness.

I would like to avail myself of this opportunity to tender my feelings of gratitude for Late Prof. Siva Prasad Bhattacharya and Prof. Chintaharan Chakrabarty for the inspiration and cooperation rendered to me.

Any formal acknowledgement deems inadequate for the sincere and constant assistance in every respect offered by my friends whose hearty wishes surround me all through and which I always feel with affection and gratitude.

I express my deep gratitude to the Publication Department of the Asiatic Society and to Dr Ashin Dasgupta, the scholar administrator.

INTRODUCTION

The need for a comprehensive study on Sanskrit Metrics has been felt for long and the need was aptly emphasised by an eminent Sanskrit Scholar who before a scholarly gathering expressed deep regret for the fact that 'metrics is the least understood and most shirked subject in the classical Sanskrit".

Science of Metrics is as old as the Vedas. From the remotest past to the present day a great bulk of the literature in India has been enshrined in the metrical lore. In spite of this Indians are very slow in recognising the importance of furnishing a comprehensive history of the Sanskrit metrics.

The subject under treatment, it is hardly exaggerating, has not been sufficiently grappled with before. The Western endeavours with their extra Indian inclinations confined themselves mostly to the Vedic metres.

Arnold in his "Vedic metre" has done an yeoman's service in preparing a history of rhythmical development of the metres found in the Rgvedic collection, which is almost indispensable for every student who intends to inscribe a comprehensive history of the Sanskrit metrics.

A fair amount of spade work in form of stray articles as well as in the form of scholarly dissertations have been done by Oldenberg, Jacobi and others.

In course of preparing the edition on Pingala Chandah Sütra Weber in his "Indische Studien" (Vol. VIII) makes an attempt to sketch a history of the Vedic metre on its theoretical side.

Jacobi devoted his whole energy on Indological studies. His special interest on metrics induced him to make an attempt to erect the steps between the Vedic and the Sanskrit metrics and to show thereby how the latter owes its origin to the former.

Edgerton tried to utilize his intimate acquaintance with Buddhist Sanskrit literature for speculation of the peculiar specimens appearing in this literature of the transition period.

Stenzler's posthumous work based on the analysis of the metrical specimens found in the extant classical Sanskrit literature is no less important, in which the reader would have a picture of the prosodical practices of the Great poets.

The labour of H.D Velankar, who, besides bringing out different manuals on Pkt and Apabhramsa metres to light prepares critical editions of the important Texts, is significant in drawing the sympathetic attention of the world of scholars to this much maligned and neglected branch of Sanskrit literature. In this magnificent work Jayadaman, Velankar along with the editions of four Texts on Sanskrit metrics, tried to give a meagre idea about the development of the Sanskrit metrics from the Veda down to the Classical. The remark of Colebrooke in his scholarly dissertation on Pkt and Skt metres that "the prosody of Sanskrit will be found to be richer than that of any other known languages" is not an inapt appraisement.

Need for a comprehensive study on metrics has been felt long by Prof. S. Bhattacharyya who in 'Jottings on Metrics' made a noble attempt to present a general picture of the methodology, plan and procedure of the extant works on Sanskrit metrics, side by side with the prosodical practices of the poets through the ages.

Stray articles and papers are not scanty in number which have contributed something to the study of the metrics. Needless to say, in this dissertation, these have been properly thrashed out, utilized and have been referred to in due places.

But in judging the magnitude of the works accomplished in other branches of the literature it should be borne in mind that the works are much fewer in this subject than in any other analogous field.

Therefore the aim of the present writer is to comprise in a single whole the entire materials available, both published and unpublished and to sketch a connected history of Sanskrit prosody under the title head—"Origin and Development of the Sanskrit Metrics", with special reference to the Prākrit metrics in order to show how the latter has helped the former.

"History is defined as the presentation in chronological order, of successive developments in the means and relations of production". The stages of development are to be pushed to the point, when the limited scope of something is enlarged; where the rigidity happens to be slackened and the inflation as well as intrusion of foreign elements have to be assimilated unconciously and incorporated intentionally. This humble venture of mine is set to task of complying with this particular view. In doing so all sorts of precautionary measure have been adopted against being led to astray from the "Terrafirma" of solid facts by an ardent desire for theorising. Because it cannot be denied that the metrical science is positive. It is also indicative in the sense that it can indicate or show how to do through manual and what has been done in practice.

The abiding value of the metrics as a Vedānga, on which the holy scripture rests, has been attested by the persistence by the Veda itself. This is not strange to see that the earliest literature, including what has guided our religious inclination has been enshrined in metrical lore. As it has been integrated with the religion, the study of the metrics meant a binding element that had to be strictly adhered to. "Yo vā aviditārṣeyacchandodaivatabrāmhanena mantrena yājoyati va' adhyāpayati vā sthānum varcchati gartam vā prapādyate pra vā mīyate. Pāpīyān sa bhavati....."

A short but lucid dissertation may be deemed necessary

for the representation of the term "chanda" to designate a half theoretical and half practical discipline in its evolutionary course.

Yāska laid down different types of etymological interpretation of the term "chanda"—"Chandāmsi Chādanāt" Nir. VII. 12.—having a root "Chad"—"Chada ācchādane"—ācchādayati stotraiḥ "Rv. VI. 75. 18. Marmāni te Varmana Chādayāmi"— Śat. Br. has laid down that as it protects it is chanda—VIII. 5, 1, 1, Yadasmā ācchayamstasmācchandāmsi". Chāndogyopaniṣad gives similar interpretation while it says that the Gods, in order to get rid of death, enter into the three Vedas and cover themselves with the metre—1.42, Devā Vai mṛtyorbivyatoḥ Trayīm Vidyām prāvišan te chandobhircchādanyadyadebhri cchādayastasmācchandāmsī"—i. e, Chadi Samvarane (III. N. 14) Curādi or "chadi ācchādane"—that which gives protection is nothing but the protective decree.

In Daivata Brāhmaņa too we find the use of it in the same sense (III. 19) Chandāmsi Chādayati iti and Sāyaņa explains it "Chando Saṃvaraṇe Chādayati Varņān iti tathā ca Nairuktam chandāmsi chādanāt". Vināyaka too explains the term, used in Sat. Bra. 11.5. the protection of the text is preserved through the metre as "Pasave yathā grhastham chādayanti dīnatva chādanāt, tathā chandāmsi varņānām ca chādayanti saṃghāta bahirbhāvanivāranāt".

A better interpretation, given by Vidhusekhar Bhattacarya (JGJRI, Vol. I.P.11. 1944, Feb P. I45) is that it is in the metre the imperishable quality of the syllables has been recognised, fixed or covered.

In the early Rgveda it also denotes "the Stotra" (Rv.VI. II. 3) "Vipromadhu chandobhavanti"—Cf. Sāyana yajue madhumanmadakaram chandah stotram bhavanti—that is why Yāska includes it in Arcati Karmanah (N. III. 14).

Suggestively enough, the same sense can be applied to what is adorable – in Rgvedic Passage too we find the word

is used to connote almost the same meaning—VIII.7.36. "Agni hi yāni purvaschando na suro arciṣā". Agni, who is the foremost of the Devas, is adorable like the Sun God. In another case, we find the use of the word "Kavicchad" in Rv. III.12. 15. "causing pleasure", where the root verb of "chanda" is chand which signifies the sense, "pleasing"—Sat. Br. VIII.5.2.1. Tānyasmā acchandayamas tāni yad asmā acchandayams Tasmācchandāmsi—they pleased him and inasmuch as they did so, they are called metres (chandas) (Chad, Chand Chadi, Chadi—Chadane, Prīnane, Prašaṃsāyām, Arcāyāṃ Nighaṇṭuḥ III. XIV).

In a very late hymn of the Rgveda, the word is mentioned in the plural (chandāmsi). Besides the RC, Sāman and Yajus it seems to retain its meaning not improbably with reference to the magical subject matter of the Atharvaveda. From denoting a hymn, it comes to mean metre in a very late verse of the Rgveda—"Kurīram chandaḥ"—X 85.8; Gāyatrādini chandāmsi......Gradually, the word denotes one kind of Vedic text as we find in the Sāmveda—cfo "Sāmagānāmṛkpāṭhayā dvau granthau vidyete, 'Chandaḥ' 'uttarā' ceti tatra chando nāmake granthe nānāvidhānām sāmnānām yonibhūtā evarcaḥ paṭhitā".

Then comes the entire Vedic literature which has been designated as "chanda"—"Svarasamskarayocchandasi niyamaḥ" (V.S.Prati.I.14) "chandovat Sūtrānibhavanti" (Mahābhāṣya 1.4.8) etc.

According to Weber, (I.S.VIII.P.4) chandas can be derived from chand not from chad. Goldstücker too retains the word chanda in the sense of "desire' - which marks the last stage of its development - (Mānava Kalpasūtra - 71).

From the psychological and practical points of view, these versions seem to be acceptable, for in hoary past i.e., in the Rv. it is used almost in the same sense. This meaning to please is not only consistent with the two legends mentioned before but psychologically also, the pleasant aspects

of the chandas-metre would be universally recognised. The whole concept of the metres as appeared in the Veda is the fruit of a constructive and rich imagination.

It can be conceded, that "chanda" as a metre, as metric, as a technical discipline must have an origin in this rich imagination and the first evidence of this discipline can be definitely traced, though in a crude form in the verses of the Rgveda itself.

The study of the evolution of the Sanskrit metrics needs, as an imperative, a comparative study with the Pkt metrics. But the account of the works on the vernacular metres are taken into consideration only when they bear the relation with the Skt metres. The detailed and separate treatment of this subject has always been avoided.

The subject under treatment has been set in the following chapters comprising the following:

- 1) Survey of the development of the techniques as appeared in the manuals on the metrical science and the preparation of the chronology of the authors of those manuals under review on the basis of the internal development.
- 2) The positive approach of this metrical science from the use of the metres in the extant literature.
- 3) The influence of the metrics of the other Indian languages which has been termed under the common name "Prakrit" on "Sanskrit" and vice versa.

Prosody as a science is firstly traceable in a definite but crude form in the occassional utterances of the seers. It is in this stage, the ground of the history has been prepared. This has been designated as the stage of revelation.

Detailed reference of metres and the technical terms pertaining to metrics appearing in the Brahmanical literature speak of the developed form of this science in the subsequent ages. The process of crystallization has been followed through the ancillary works like Prātiśākhyas,

Nidana Sutra and Sankhyayana Srauta Sutras. It is in this stage that they have had their treatment and recognition as the Scientific principles. This stage has been termed the formative stage.

In the above mentioned works we get a sectional treatment of metrics whose principal aim is to deal with the six Vedāngas. These are the latest offshoots of the earlier scientific literature and preceding the classical school of metrics. At last in the work of the Vedānga Chanda of Pingala we come upon a comprehensive treatment of the Vedic metrics in general. From this the real history rolls on.

In order to achieve a definite and fruitful result the vast period of the history has been marked by several well defined phases—(1) Pingala and his immediate successors (2) Vrttaratnākara to Prākrit Paingalam (3) Prākrit Paingalam to Modern writers.

First phase covers more than ten centries and includes some of the great names in the history of this discipline like those of Bharata, Jayadeva, Jānāśraya and other Prākrit versifiers who too paid their homage to this orthodox school.

With VIttaratnākara on the one hand and the works of Jaina writers on the others, begins the second period of history of comparatively brief but illuminating stage of extraordinary creative genius. It is in this stage, in response to the use of the practice it incorporates some of the proceeding of the Vernacular manual, thus allowing the slow integration with the non classic elements.

Most of the works have been set down in the line of Vṛttaratnākara and in this age we find some of the works of prominent writers like Hemacandra etc.

The result of the integration has been described with distinction in the manuals of the stage immediately following this period. The appearance of the Prākrit Paingalam ushers in a new era in the history of Sanskrit metrics.

It is in the first half of the first chapter, the history of the metrics has been set forth through divergent systems and theories. Bearing of the chronological result of these works on our enquiry in general, has been based on the tentative rough division of different periods of history noticing the dominating influence of the standard works comprised in them. Depending on these divisions the subsequent subchapter proceeds to set down the relative chronology of the authors.

More stress has been laid on essential of doctrines and the minor details have been omitted. Greater emphasis has been put on the earlier writers who cover the creative periods of the discipline against the later writers who show in the main excessive dependance on their predecessors. Only standard authors have been selected with due regard to their historical importance.

Endeavours have been made to determine with exactness the date and the locality or personality of the authors by both internal and external evidences but as in other branches of Sanskrit literature so also in the field of metrics nothing could be determined with any degree of certainty.

In chapter II we have taken into consideration the vast domain of the Vedic literature as it represents the earliest available phase of Indian metrical lore. The "Vedic Literature" under review comprises the Rgvedas, the Atharvavedas, the metrical portion of the Yajurveda and the Brāhmanas and scientific literature enshrined in metrical form subsequently leading up to Epics and classical literature. The complete survey of the metrical use in the Vedas exhibits both the "external feature" and the "internal character" of the metres. It is the former which forms the core of the Vedic manuals on metrics. The present discourse is able to show how the relevant applied metres bear points of coincidence with the extant theories. The very features of these "verse structures", "pada forms", "hymn

compositions" are the types that have left their casts on the corresponding metrical features of the Sanskrit and Prākrit verse forms. These have also been included in the purview of our discussion.

Due attention has been paid to note the "internal character" or the metrical features by which the Vedic metres are proved to be postulated as the forerunner of the classical metres. The study of this internal rhythm has enabled us to have a fruitful result of greater historical importance, because, in the classical metres, it is the internal rhythm with which they are solely concerned.

The period succeeding the Vedic one was characterized by the many sided literary activities. We are not concerned with the subject matter of these literature, but as they are represented by various languages and are enshrined in the metrical compositions, their metrical specimens have been properly investigated.

The literary products of this period may be categorised under four heads; Brahmanical, Epic, Jaina and Buddhist according to the rise of the different religious sects, i. e., the Brāhmanas, the Buddhists and the Jainas each with rich and distinctive literature of its own.

- I. Direct flow of Brahmanical cult through the last remnants of the Vedic literature has been included in the part provided for the Vedic literature.
- II. Secular literature in the form of Epic presents a distinct phase in which more practical forms of Skt metrical specimens were employed which was more rigid and mechanical than those of the last remnants of the Vedic literature like Bihaddevatā and Upanişadas.

Endeavours also have been made to sieve out a considerable portion of the Buddhist and Jaina Texts preserved in Pāli and in Ārşa Pkt. The distinctive character-

istics of these metrical specimens are that in their early phase, they are the prototype of the Vedic Anuştubh and gradually they begin to change their colour to shape their forms with mātrā units. In these scriptures, we find the mātrā metres in very crude forms which gradually had their shapes being systematized by the Sanskrit prosodical principles.

Side by side, we can by no means do away with the epigraphical literature on the one hand and the Buddhist Sanskrit literature on the other. The latter has provided us for a considerable quantity of compositions in the language of which the elements of the Purāņic, the Prākritic and the Pāli are acute and glaringly exposed These compositions yield a peculiar type of metrical specimens being hybridized with the Sanskrit syllabic metres and Prākrit mātrā metres.

Among the vast multitudes of the epigraphical literature we have for our purpose taken into consideration only a limited few, enshined in Prākrit and Sanskrit languages. The earliest of them have been preserved in Pkt language and yielded the mātrā metres, sometimes in the forms of Pro-Aryā, thus coinciding with our assumption that the mātrā to metrical forms have their origin in non-Sanskrit language.

Canarese inscriptions of the South are also taken for scansion. The compositions of these inscriptions had profusely employed distinct types of syllabic metres which have been mainly appropriated by the Southern Prosodists like Jayakīrti, Hemacandra, Nāgavarmaņ who generally concentrated their endeavours in the South.

In the field of the mātrā metres, their contribution is more significant in producing Şatpadī, etc. The musical elements of Canarese mātrā metres lured the corresponding Sanskrit poets so much that they could not abstain themselves from employing these metres. The subsequent

manuals, like those of Jayakīrti and Nāgavarmā, incorporate them.

The last chapter is prepared to show the last phase of the development of the history of the Skt metrics where the Pkt metres has a prominent role to play. In fact, the account of the history of the classical Skt. metre will be incomplete if the influence of Sanskrit metres on other Indian languages and the reverberation of the other Indian languages on the corresponding Skt metrical compositions are left out of our discussion.

It has been shown, that the classical Sanskrit metres exerted influences on the Pāli and Prākrit literature during the early and middle ages respectively. On theoretical side, the Pkt metres also owed their allegiance to the authority of the Sanskrit metrics. Gradually, the Pkt metrics when came into prominence, took hold of the whole regime. The early Prākrit writers maintained the quantitative value of syllable very rigidly in the case of the Akşaravrttas, whereas in the late century, Sanskrit poets like Caturbhūja introduced rhymed feet in his Kāvya Haricaritam. As a result of such an attitude, metres have become more and more widely extended in their scope.

Finally it can be said that the attempt made here isintended to be historical rather than expository.

The bibliographies and the references can not be claimed to be exhaustive. But it would not perhaps be an exaggeration to say that a careful use has been made of the available works of the previous scholars as far as practicable. No stone has been left unturned with a view to making our conclusions based on sound footings.

With this prelude I place this thesis before the academic world and I hope it will speak to them for itself.

CHAPTER I

SANSKRIT METRICS: ITS DIFFERENT STAGES OF EVOLUTION

1. SYSTEMS OF SANSKRIT METRICS

It is well known that Sanskrit metrics has emerged in the form of a branch of learning auxiliary to Vedic study, as the bulk of the recorded literature of the Veda is in the verse form. This has almost become inevitable as bearing on the Vedic practice being integrated with religion. The study of metrics has been so emphasized that it has been described as the support or the lower limb on which the body of the Veda rests. That is why it has been felt that it is to be scrupulously studied and understood at par with the study of the main Veda.

The origin of this science is to be sought as mystical as that of the Veda itself. Like the vast multitudes of the Vedic literature it happened to be looked upon almost as "revealed" or "Apauruṣeya". It perhaps would not be an exaggeration if the very age when the first knowledge of metrics came into existence with metrical composition, is called the age of "revelation" of the metrical science. Chandaḥ as a Śāstra, in other words, prosody as a discipline is as old as the Rgveda itself. Besides, in the other Samhitās,

Chandah pādau tu vedasya hastau kalpo'tha pathyate Jyotiṣāmayanam cakṣur niruktam śrotramucyate.

Rgvedopatghātaḥ — Eteṣām Vedārthopakāriņām ṣaṇṇām granthānām Vedāngatvam śikṣāyām evamudiritara

in the Brāhmaņas, in the earlier Upaniṣads we meet numerous terms and passages relating to prosodical science, in which we find for the first time the real basis for the system of the metrics. The scientific speculation uttered through the liturgical performances in the age of Brāhmaṇa have been sorted out subjectwise in the age of Prātiśākhya, where the subjects dealt with have been given place in a single text.

The first evidence of the definite but somewhat crude activity in this direction can be found in well developed forms in these types of works, the sprout of which are already in the liturgical passages of the Brāhmaṇas. So the period in which this course of development can be noticed is to be described as the formative stage of the prosodical science.

Historic stages of the prosody begins with the Vedānga age when the single test or codex has been devoted for one specialised subject. This is found in the work of Vedānga chandaḥ sūtra, where however we found a comprehensive treatment of the Vedic and Skt. prosody. This is the only work which has been presented by tradition as serving the dual purpose; representing the whole Vedānga chandaḥ as well as the earliest work on Skt. metrics. In the age following it, a number of works based on this sūtra work which are imbibed in the spirit and followed the manner of this very standard work came to be introduced.

For a long time we find no departure from this old school excepting a little modifications in the shape of slight elaborations of soma of the sūtras; or by effecting some modifications of expressions here and there; or by introducing certain forms of exposition. This sort of affairs persisted for a period extending over more than ten or eleven centuries and this can be said a fruitful creative stage which came to an end with the appearance of Vṛttaratnākara.

With the Vṛttaratnākara on the one hand and the works of Jaina writers on the other, begins the next period of CC-0. Jangamwadi Math Collection. Digitized by eGangotri period of

the history of Skt metrics which is a comparatively brief one yet it deserves to be noted as a stage of creative genius.

In this stage no consideration has been paid to the Vedic works but there develops a tendency of absorbing non-classic elements in the fold of Skt. metrics.

Most of the works belonging to this period follow the tract of Vrttaratnākara sometimes in the same stereotyped manner and phraseology differing from each other only on the issues of minor importance. This stage at the same time can be regarded as a stage of integrated principles where we find the slow departure from the dogmatic formalism of scholastic discipline, which sank to the level of conventionalism and stagnancy. Besides, it has been characterised by the appearance of a number of works like commentaries engaged in explaining and expanding the contents of the standard work.

The result of the integration can be discerned with a distinct mark in the period following it. Appearance of Prakrit Pingalam in the horizon of this period is to usher in a new era. Along with some independent works embodied after the fashion of Pkt. Pingalam with the various plentiful but inferior manuals in which new experiments were tried, new vein of thoughts were opened, a new order of writers were created, we have the third epoch of great fertility during which all the older ideas being crucially criticised are transmuted into things better suited to the needs of the new era.

Consequently, we have to meet with purely classical, proto-classical, non-classical works replenishing the necessary deficiencies regarding classical issues, new ideas conforming to none of the authorities.

This is the brief resume of the following chapter chiefly devoted to the establishing the course of development of the prosodical techniques dealt with in different manuals and the fruitful activity of the pioneer authors who predominantly range over three long periods of history of Skt. metrics in the post-Vedanga age.

i) The Age of the Revelation:

Prosody as a discipline is as old as the Veda. One of the Rgvedic passages in course of giving us a somewhat fanciful account of the divine origin of the three Vedas mentioned the name of the supposed discipline.¹

Gāyatrī and Triṣṭubh are mentioned by their very names in many verses of the Rgveda not only in the archaic portions² but also in other places where the said metres are eulogised as they have captured the heart of the people.³

Three metres have used in the respective three savanas.⁴ Excellence of these three types have also been described in the Atharvayeda.

Seven metres have been recognized in many verses of the Rgveda⁵ and it has also been stated that they are measured by the syllables.

Saptagrāmyāh paśavah saptāranyah, saptacchandāmsi. T.S. II.4.6.2.

Seven metres with their respective designations and presiding deities have been referred to in their seriality in two consecutive verses in the tenth Mandala. Same verses have been repeated in the Atharvaveda, only with the difference that the 5th place has been allotted to the Pankti while the same place was given to Virāt in the Rgveda. Pankti has been described as the metre of five syllables (T. S. I, 7. 11. 2)

Pushā pañcākşareņa panktim udājayat. cf. T. Br. Pañcākşara Panktih (II. 7. 10. 2).

Taittirīya Samhitā knew Virāj as containing thirty syllables i. e. two syllables less than that of Anuştubh.

In T. S. in addition, however, it has been laid down that Virāt has ten syllables, Virāta is food. In Kāth S. XX we got the expression "asau vai svarād, iyam virāt". Besides the five metres, Gāyatrī, Tristubh, Jagatī, Anuştubh and the Paūkti. T. S. knew the name of the other metres such as Padapaūkti, the Akṣarapaūkti, the Vistāra Paūkti metres. Aticchandas has been described in T. S. as the highest of the

metres (VI. 1. 9. 3). But has been referred to in Vājasaneyī Samhitā (vs. XXIV. 12. 13). In another place, Kakubh, a new one, appeared with Bṛhatī, Śato Bṛhatī, Uṣṇiha and Virāja.¹ In the Brick sacrifice, bricks are addressed as metres and that the Risis are acquainted with various types of metres can be ascertained from the designation given to these bricks conceived of as metres.²

Respective Deities of the metres are also addressed. In T. S. Sakkvari is no more eight syllabic seven padas metres but is one which consists of one Gāyatrī and one Tristubh. Isosyllabic nature of the Vedic verse is also referred to in the Revedic stanza, The very designations of the stanzas according to the number of the constituent parts, i. e. Feet, appeared not only in later Vedas but also in the Reveda. In T. S. however, in addition to Dvipadā, Tripadā and Catuspadā, we get references of Saptapadā being the very mark of Sakkvari. Here the pāda is used in the sense of the constituent parts rather than the fourth part of the verse.

In the Atharvaveda, and V. S. there are references of RC

and the half RC. In T.S. there lies clear enumeration of the number of the syllables allotted for each pada in each metre. 2

Elucidation of the terms used in the mantras are clearly made in another place where we find the term Vāsavaḥ indicating the number eight, Rudra the number eleven and the Aditya the twelve.³

Total number of the syllables of the chandas has also been described fully.4

The class of the metres without their pāda division, which appeared in later sūtra works and Prātišākhyas got their treatment in T. S. The Daivichandaḥ is the smallest or the junior-most. Asura chandaḥ is the largest or the senior-most. By the performance of the Şodośini sacrifice, the largest one is ousted by the smaller one. In another place it has been referred to that Indra won both the metres of the God and the Manuşya of which syllables 1 and 3 belong to the former, 4 and 8 to the latter. This Manuşya chandaḥ is perhaps the another name for Prajāpati which contains 8 syllables.

ii) Formative Stage: .

The formative stage of history of the science of prosody begins with the age of the Brāhmaņas and of the Āraṇyakas where along with the explanation of the sacrificial rituals we find discussions on matters of metrics in more elaborate form. Innumerable are the references. Verily T. Saṃhitā proclaims—"RC verses are limited, the Sāmanas are limited and the Yajur are limited but of the Brāhmaṇa there is no end".1

Ait. Br. knew the seven metres in which Virāţ is absent and Pankti is installed.² "Pankti vai parama virāţ"—thus has been laid down by P. Br.³ Śat. Br. too specially eulogized the three metres.⁴ Ait. Br. too accepts these three metres as to be the Principal one.⁵ In Brāhmanas and Aranyakas Virāţ has assumed another new form having thirty three syllables.⁶

Thus the metre Virāt appears not in a single form as in the Rgveda. It is Virāt while it contains ten syllables, it is Uṣṇig and Gāyatrī as it has three padas; while it contains eleven syllables it is like Triṣṭubh, but it becomes Anuṣṭubh while it has thirty three syllables (one more than Anuṣṭubh). But in most places Virāt has been described as ten

syllabic. In Sat. Bra. it can be found as the 8th metreile. a class by itself outside the seven metres. That which contains thirty syllables is Virāt and that which has thirty four syllables is Svarāt. Pañca. Br. described all the four Virājas number one is 10. sy. 2nd is 20 sy, 3rd is 30 sy, and the largest is the 40 syllabic. In Sat. Br. not only the seven metres with their respective number of syllables increased by four has been enumerated but the respective groups, Ekapadā, Dvipadā with 10 syllables and 20 syllables respectively, have been referred to. Verily speaking Ekapadā contains ten syllables mostly, Pankti is pañcapadā. Svarāt has thirty four syllables—two more than Anuştubh.

No metre would be deprived of one or two syllables from the total number of syllables scheduled for them. Deficiency in no case can be accepted. So with the help of the process of Sampad the deficiency of the number should be patched up. Sānk. Brāhmana for the first time utilizes this.

Gradually, we become acquainted with the term "Virāj" a modified term of Virāt, which for technical use is applied

Catvāra tuyāgaḥ şaḍ Rcaḥ sā virāṭ daśinītadvirāji yajñam daśinyām;

Most of the Ekapadās are ten syllabic—cf. Vaimadyah saika dasinimukhato virāţ; Pañca. 12.19. Pañcarccabhavati Pañca Padā Pankti.

Ait. Br. 1.1.6. Na va ekenākşareņa cchandāmsi viyanti no dvābhyām yadvirāţ.

for the classes which had excess number of letters i. e, 34 syllables and those which contain deficit number of syllables. 1 i. e., 30 syllabies. That is why the term "Virāţ" has been explained by Yāska—Virājanād, Virādhanād Vā Viprāpanād Vā²...Virājanād sampūrņakṣarā, Virādhanād unākṣarā, Viprāpanādadhikakṣarā. If there arises any anomaly in the preservation of the exact number of syllables, the process "Sampad" should be applied, the term has been used in the sense"creating exactness". That is why Sayana explains the very term used in the Ait. Br. 3 In the sense of "avoiding any anomalies arising''. Pañcaviṃśa Brāhmaṇa is acquainted with the term Bhūrija.4 In sutra works these terminologies assumed the form of technical terms. In San. Sr. Sūtra and Nidāna Sūtra instead of Virāṭ and Svarāṭ, there are the terms Nicṛd and Bhūrij.5 The term "Sampada" receives an elaborate exposition in the Nidānasūtra and other later works. In the RK. Pr. we have a detailed explanation of the "four principles" that are to be applied for the restoration of the exact number in such

cases. In more condensed form the process has been preserved by Vedānga chandaḥ "Iyādinā purāṇaḥ" Rkprātiśākhya Rganukramaṇī and Vedānga chandaḥ—embrace all the terminologies discussed above. Virāṭ and Svarāṭ have been used for those metres which are deficient and in excess by two syllables respectively and Nicṛd and Bhūrij when by one syllable. It is in the Śān. Śr. Sū we first meet with these terminologies, which culminate all the four terms under the two.

The second group of metre beginning from Atijagatī is "Aticcahandas" group —it is that which is higher than first group or principal metres. Sat. Br. knew that all the principal metres belonged to this Aticchandas class. Ait. Br. pointed out the metre of the Sükta RV. 87.1-66 as Atijāgata which belongs to Aticchandas group. In some interesting passage

 Tam nyūmkaytyannam vai nyunkonnādyame vāsmimstaddadhāti sa jāgata vātijāgato vā sarvam vā idam jāgatam vātijāgatam.

Aticchandas are described as belly which devoured up all the metres and inasmuch as it does so, it is called "Aticchandas"—then mystically Aticchandas; for the Gods love to use mystically.¹

This class of metre is called Aticchandah, because it is made of the essence of the principal metres beginning with Gāyatrī and it contains more syllables than those of the principal group.²

For the higher seven metres, Brāhmaņas took scarcely notice except in a very restricted cases—in Sat. Br. VI. 7.25. We meet with the use of the term Vikṛti.³ In other two place i. e. VI. 7.29 we saw the terms used. The commentators while explaining the passage referred to the given metre as Kṛti. But it would be counted as 73 syllables against the Vikṛti which consists of 88 syllables and Kṛti which has only 80 syllables.

Besides these Aticchandas, Pañca Vimsa Brāhmaņa knew of other metres, one of which is Satobrhatī named by Pingala as Tāṇḍinaḥ. Tāṇḍya Brāhmaṇa eulogised it as the powerful metre by which the Gods acquired the world. The detail of this metre has been given in the following declaration where it has been described as a metre of 36 syllables. In three pādas the given syllables have been distributed,

Śat. Br. VIII.6.2.13. Udaramaticchandaḥ! Paśavo vai chandaṃsyamnāmapaśava Udaraṃ vānnamatyudaraṃ hi vā'nnamatti tasmādya dodaramannam prāpnotyatha Tajjagdham yātayāmanūpam bhavati tadyadeṣā paśuṃśchandāṃsyatti tasmādatticchanda aticchandā ha vai tāmatichandā.

having 12 syllables in each. 1

Pañca Br. describes the respective syllables of the Daivī and Asurī metre and also shows how Prajāpati came into being between the aforesaid metres, Prajāpati became Anuṣṭubh, i. e. contains 8 syllables – thus laid down the same Brāhmaṇa. Augmentation of syllable in case of Daivī and diminution of the same in case of Asuri has also been described incidentally. In Nidānasūtra for the first time develops another new form of Prajāpati which too begins from the number eight. Pañca Br. yarns out a number of interesting stories in connection with the respective number of syllables of the group.

The Gods and the Asuras were in perpetual conflict, they could not decide the issue. Asura finding no way, became metre and concealed themselves. The Gods when came to know this, took the initial of the given mantra and defeated the Asuras. Most noteworthy fact in this place is that the given metre contains 15 syllables. Respective syllables of the Prajāpaticchandaḥ also has been hinted in Pañca. Br. "Kayānaścitra abhuvaditi karatyastena prājāpatyaḥ kohi ..." "Kayānaścitra abhuva" consists of eight syllables.

The sum total of the three groups Daivi, Asura and

^{4.} Rk Prātišākhya—XVI.4 ed. P.N. Sastri. 1927. The classification of metre without their pada division has been elaborately dealt by a late century comm. on P. Ch. Sūtra, who categorised it under

Prājāpatya is to constitute the Ārṣīcchandaḥ. To Nidāna sūtra¹ too are known these groups, Prātišākhya² adds another group Brāhmī which is the culmination of Ārci, Yājuṣī and Sāmni. But all the manuals are concerned with the Āṛṣī Chandaḥ. Subsequent manuals³ dealt with these topics, follows Rkprātišākhya faithfully. As Anukramaṇī is directly concerned with the Ārṣicchandaḥ it avoids this issue.⁴

The respective deities that have been enumerated in Sat. Br. are somewhat in elaborated forms. Some of them is slightly changed. The same Brāhmaṇa pointed out direct relation of Gāyatrī with Agni⁶. Viśvedevā which has been mentioned as the deity of Jagatī in the Rgveda and other manuals of the late century is in Sat. Bra. the deity of Anuṣṭubh and is replaced by Āditya. Besides, the deities of other metres, such as Dvipadā Vichhandaḥ, Aticchandaḥ have been recorded. Viṣṇu has been described as the deity of Dvipadā against Prātīsākhya⁸ which however lays down

the prose metre. Because after the treatment of it the ch. III begins with the sūtra "Pāda" Vide Bhāṣyarāja—ASB.III.A.76. Fol. 12b-13A. Atra vaidikam gadya dvividham nirupapada...Fol. 13a. Puruṣam, the earliest reference of which can be found in Paṇca Br¹. Puruṣam is Dvipadā. Brhaddevatā too follows this whole-heartedly.² Indra is the deity of both metres³, Paṅkti and Triṣṭubh. Śat. Br. however speaks otherwise about Paṅkti.⁴ Piṅgala lays that the deity of Paṅkti is Mitrāvaruṇau, which however has been prescribed for Virāṭ from the age of Rgveda, when the conception of Svarāja has not been developed.⁵ That is why in Bṛhaddevatā³ we find Mitrāvaruṇau as the deities of Virāṭ and Svarāt. Rk Prā. and Bṛhaddevatā are in agreement with the enumeration of Śat. Br. for the position of deities of the metres Aticchandaḥ and Bicchandaḥ as being Prajāpati and Vāyu.⁵

It is in the formative stage the application of the metrical units for the definition of the metres and the use of the terminologies for the numbers have been introduced in very crude manner, that has been subtly hinted at in the T.S. Rk Prā. laid down the rule that unit of eight syllables and ten syllables can be named as Gāyatrī and Virāji and those of eleven and twelve as Triṣṭubh, Jagatī respectively. But these

terms have been applied in very restricted cases in Rk Prā.¹ whereas in Sarvānukramaṇī there are saṃjñā, therefore these ought to be applied in a good many cases.² This has been more figuratively described by Piṅgala, viz. Gāyatra vasavaḥ, Jāgatya ādityaḥ, Virāja diśaḥ³ Piṅgala utilised these saṃjñā in all the sutras. In addition, we are acquainted with two other terms Rtu and Rṣi—indicating the number six and seven, respectively These two cannot be found in earlier manuals.⁴

Prāya, Akṣara and Vṛtta—among these constituent elements of a pāda, vṛtta is the most indispensable factor. Neither any Brāhmaṇa nor Sān Śr. Sū took notice of it. It is in Nidānasūtra⁵ that it has been recognized for the first time. The penultimate syllable of the eight and twelve syllabled pada would contain the eight syllables and those of 10 and 11 syllables have the heavy ones. Other padas are to be composed of very recast of these pādas mentioned above. Yādavaprakāśa, commentator of P. ch su explains it more elaborately—"Guruvṛttitvāni" is that by which the penultimate has the heavy syllable.

Tatra Daśaikadaśā dvādaśākṣarāṇam vairāja Traiṣṭubhajāgata iti saṃjñā. Anādeśecaṣṭakṣarā pādaḥ.

^{6.} XVII.21.22 Rk Prātiśākhya.

XVII. 23. Ibid. Estaiśchandāmsi Vartante Sarvānyairatoʻlpasah Etadvikāra evānye sarve tu prākṛtā samāh.

^{8.} Bhāṣya on the sūtra III.6. P. Ch. Sūtra Guruvṛttitvam copottamasyakṣarasya gurutvam. Eṣa eva gurulaghuvinyāso vaidikeṣu chandaḥsu Vṛttirvṛttamiti cābhidhiyate athaparam vṛttilakṣaṇaṇ Ekādaśākṣaradvādaśākṣarā ṣaṣṭham navam cakṣaraṃ laghueva syāt. Aṣṭamam daśamañcai va gurveva syāt. Tathāṣṭakṣarasya padasya pañcamam saptamam laghveva syāt ṣaṣṭham gurveva syāt.

The conceptions of vitti or vitta in its two forms, the laghuvitti and the guruvitti depend wholly on the shortness and the length of the vowels. As the "Chandan Purusa" is made of the syllables we should see how the Aksara appeared in the consecutive manuals.

In Brāhmaṇas the term Akṣara is indestructible, imperishable because of its syllabic quantity.² That is why Sat. Br. lays down that in chandapāda, the number of syllable should neither be less nor more. Sometimes this word "Akṣaram" connotes the term Alphabet. Thus the word "om" has been described as Tryakṣaram, what contains three alphabets and nor the syllables. Akṣaram comprises both types of svaras, Dīrghas and Hrasvas.⁴ All the Prātiśākhyas knew the relative weight and volume of these two types. Brāhmaṇas made only passing reference to them.⁵ Excepting the Nidānasūtra all the sūtra works are silent about it. Lāt. Śr. Śū. however speaks of only Akāram which is heavy.⁶ T. P. recognises R and L as the specimens of Hrasva⁷ and Pingala

adopted this mode of expression. Two Hrasvas are equivalent to one Dīrgha and a consonant has half the quantity of a Hrasva. And those syllables which end with Vyañjanam, those which are Dīrghas and those which are before the conjunct consonant are to be counted as heavy and the rest is light. Athav. Prāt. echoed this but quite in an elaborate manner and added that at the end of the pada the syllable will be heavy. Taittiriya restricts the heaviness to such final syllable as ends with a consonant. Rk. Prā. makes no mention of this case. It has been more clearly put down by the Vāj. Prā. The sūtra "mātrā ca"—thus introduced Vāj. Prā. Ath. Prā. too adopts it. Verily speaking for the use of correct pronunciation the knowledge of quantity of the vowel i. e. mātrā is necessary, that is why the Prātišākhyas dealt with them.

We may close our survey by adding a few notes on the Arithmetical formulas which got their primary references in the Brāhmaņas and on the Process of law of permutation, and combination, discerned in the pāda arrangement of the Vedic manual makers. Finally in the close of the chapter, we would show how these Pāda arrangements in the Vedic metres are in harmony with the designations given to them.

Mathematical calculations made in the Brāhmaņas got

their codification through the formulas. Ait. Brā.¹ laid down, 16 Gāyatrī verses are equal to 12 Anuştubhas. Ait.² Ār. dilates that the thousand Brhatī should be substituted by one thousand and one hundred twenty five Anuştubh because, they are equal in their number. In Pañca. Br.³ on the other hand, we got that if one Gāyatrī has been added to three Uşṇih one should have three Brhatīs.

Gāyatrī and Jāgata, Uṣṇik and Triṣṭubh, Pankti and Anuṣṭubh are equal to two Bṛhatīs, seven Gāyatrīs are completed in six Uṣṇih—laid down by Ait. Ār. Similarly, it can be shown that eleven Jāgatis are equal to twelve Triṣṭubh. This calculation has been recommended in Sūtra literature and got a formula in Śān. Śr. Sū. sat Br. too show that 12000 Bṛhatī is equal to 208000 Pankti.

Lastly, it can be shown that the very physical forms of

some metres be speaks of the significance of the names given to them.

Gāyatrī can be etymologically defined, Gāyate va stutikarmmaṇaḥ¹ by which the Gods are eulogised. Uṇ̄īg² "utsnāta bhavanti" that has been overflowed by the excess of the number of syllables than Gāyatrī. The syllabic arrangement of the Uṣṇiḥ comprising two eight syllabic pādas preceded by the 12 syllabic one³—reminds us of the Turban whose back portion is somewhat uplevelled. That is why Yāska describes it "upamā nivandhamuṣṇ̄ṣavativa bhavanti." Likewise, Anuṣṭubh is the enlarged form of Gāyatrī, because the "ṣṭubh" has root verb "stamp" which means "to step".4

Equally, can the metre Kakubh be referred to, the very figure of which has been represented by its very syllabic arrangement. Kakup is that which possesses a heap on the back "kakuviti pṛṣihe samunnataḥ pradeśaḥ yacca kubjasyaiva bhavanti". Bṛhatī parivahanāt"—Bṛhatī is the metre which contains excess syllables than Anuṣṭubh, Triṣṭubh is the "Tīrṇatamā cchandaḥ"—exceeds Gāyatrī and other metres by the number of uses. It contains three junctures like thunderbolt. These three thunderbolts can be explained as the three blocks of rhythm conceived by the modern scholars.

Pipīlikāmadhyā whose very form is made of the syllabic units, has its middle part always thinner than the two sides. The ants have middle portion lowered. That is why Yāska laid down "pipilikāmadyetyaupamikam". Besides, we can refer to "nyaṅkuśārini" just beautiful like a small graceful softed antelope. "Nāgi" serpent like form having two nine syllabic pada preceded by one six syllabic. Vārāhi a female bearform naturally whose forepart is pointed. The very syllabic arrangement of the said metre told such 'Yavamadhyā' forms a class by itself whose middle part is thick like Barley. "Vardhamāna" is the padas with the augmented syllables. Tanuśira whose head is lean has pada form -11+11+5.7

In the foregoing pages an attempt has been made to give a connected account of the early speculations on the Vedic metrics that started as early as the Vedic period and on the basis of the facts available to us it has been shown that these early speculations are actually the precursors of what turned up as a result of the efforts of the metricists belonging to the subsequent ages. Incidentally the relation between the Vedic and the classical metrics has also been examined in its proper perspective.

We shall now proceed on to consider the history of development of Skt. prosody which begins with the remarkable

treatise ascribed to Pingala, the only recognised work on Vedanga chandah that also includes in its scope the consideration of the classical metres along with the Vedic ones.

Standardisation of the entire scheme of the Vedic metrics seems to be finalised in this work by harmonising the divergent trends of earlier speculations in a comprehensive scheme of integration.

Looking at chronologically it may be said that the period of development of Skt. metrics, roughly speaking, extends over two thousand years, that is, from 2nd century B. C. to 1800 A. D.

It is quite natural that the growth did not run in a smooth line in its process of development through this long period and for the convenience of our study we shall have to divide this course of history into several well defined periods.

This would enable us to settle its relative chronology as a workable basis for a historical treatment. Broadly speaking, there are three clearly discernible stages of this long standing history of systemisation of Skt. metrics that may be summed up as follows:—The first stage begins as we have said before with Pingala and it ends with the Vrttaratnākara of Kedārabhatta. This one is followed by a period which ends with Pkt. Pingala and the last one extends to the period when Jagannātha Kavirāja came into field with his works on metrics.

1) - The first stage of the history of Skt. metrics starts with Pingala and ends with Vittaratnākara. This period is characterized as the most creative age in which different schools with their different trends came into existence and in consideration of the general outlines of their approach it appears there were at least three schools. These schools, submitting to the great authority in the fundamentals, differ ni minor details.

A bird's eye survey of the methodology and the contents of the extant manuals would show that Pingala had a circle of his followers up to the end of the 10th century. These followers had their own way to establish and to propagate the theories but could not escape the influence of the great master.

Obviously the immediate followers are generally of more orthodox type than their successors and tried to imitate the great innovator at every step. Among them can be named Jayaveda, the anonymous compiler of the chapters of Agnipurāna dealing with metrics. For a long time, we find no departure from the old school in the acceptance of the terminologies in their fundamentals.

This trend continued for a period extending more than ten centuries and included some of the new schools in the field like those of Bharata and Jānāśrayi.

The first thing that will strike a careful observer is that the chapters II, III and a part of the IVth chapter of Pingala's cchanda sutra deal exclusively with the Vedic metrics having no organic relation with the rest of the work. The chapter of Samiña has no function in its bearing to the Vedic metrics because, the sutras 1-7 of the chapter III are directly connected with Samjñā Paribhāṣā applicable to the Vedic metrics only. Jayadeva however is complete in the treatment of the Vedic metres within the three chapters. The Pingala ch. sū. seems to have been preserved in two recensions. The first recension is a bigger one containing a few more sutras that are not traceable in other ones. Yadavaprakasa the earliest of the extant commentator, generally preserves the faithful readings which have been acknowledged by the subsequent writers and the commentators.

Halāyudha has left out certain sūtras regarding the metres below the Gāyatrī class—which is read as one sūtra by

Yādavaprakāsa,1 as three sūtras by Bhāsyarāja2 and as five sūtras by Sadgurušisva3 - one in ch. VI.16. which Yādavaprakāśa includes as the 1st sūtra of 11 syllabled metres. Whereas Bhāsvarāja reads as the last sūtra of the 10 syllabled class; -one more sutra has been noted by Halayudha, but not included that is 12 sutra of ch. VIII4. From Jayadeva onwa ds all writers even Janasravi who follow Pingala recognize this pratyaya. Bhāşyarāja noted this and accused Halavudha of not having dealt with it. Certain sutrasi.e. III 65, III 66 and VIII 14 are acknowledged by all as belong to chandah sutra. But Halayudha did not admit this and added eighteen sutras in ch. VIII, all in a series which did not form part of the original number of sutras varies in different commentaries. Bhāṣyarāja contains three hundred whereas Yādavaprakāśa and Halāyudha recommended two hundred eighty eight and three hundred nine sutras respectively.5

Jayaveda and Agnipurāņa, the immediate followers of Pingala, deal with the Vedic metres. The Nāṭyaśāstra and Jānāśrayī left out the Vedic metres from their purview but they took up the Vedic terminologies and made an endeavour to apply them to Laukika metres possibly with a view to tracing the connecting link.

Nāṭyaśāstra recommends however that all the syllabic metres fall into three classes such as divine, human and semidivine. The first group comprising seven principal metres from Gāyatrī to Jagatī belongs to divine or divyo class. Abhinavagupta thinks that these metres are found generally in the Stotra and Śāstra.

The Aticchanda group of metres has been grouped as Divyetara and the third group on the other hand comprises the rest. A passage in NS describing the scope of metrics—i. e. Sampadvirāma² pādaśca devatā sthānamakṣaram varṇaḥ³ svara vidhivṛttamiti chandogatovidhiḥ—of which the issues of Sampad. Devatā and Sthānam are purely Vedic and NS had nothing to do with them.

But these are mentioned perhaps by the way of the customary observance of the tradition which the "fifth veda" could not possibly escape when it took up the metrics for its consideration. It is noteworthy in this connection that Pingala the pioneer of the Skt metricist has left for us a systematic record of that age old tradition and it is obvious NS being belonged to the orthodox period followed the tradition represented by Pingala.

The issue of ten sutras4 or ten varņas5 in Pingala ch.

sūtra has been dealt with in different way by various commentators from the standpoint of their bearing to Śāstra in general. Practically in the body of the Śāstra there are more than ten sūtras essential for the understanding of the Śāstra. But there exist also ten varņas which like ten quarters pervaded the whole world. These ten sūtras or varņas point at the efficacy of a grounding in the ten categories.

Nāţyaśāstra also maintained the tradition by nothing this ten fundamental requisites of which we made mention before.

Incidentally, Jānāśrayī which made extensive treatment of these because of their importance in the understanding of the "modus operandi" of metres must be mentioned.

Practically the incidence of the number ten has a particular bearing in the case of Pingala's ch. sūtra, an integrated work on Vaidika and Laukika chandas.

These ten requisites are—(a) Gana (metrical units) (b) Samjñā (appellations) (c) Sampad—the process of resolution in case of the Vedic metres which Abhinava tries to show that it is applicable only to Vedic Verse or prototype in Kāvya.¹ But Jānāśrayī who left out of consideration the Vedic metrics in its sphere, places the illustrative Laukika verses in which that process has been applied.² Of the rest the four are (d) Devata (deity), (e) svara, (f) gotra and (g) varna have the direct bearing to the Vedic metres. Bharata includes among these the sthānam—which has not been recognised by Yā. Pr. In NS it comprises two categories—Śarīrasthānam and Digāśrayasthānam. This particular sthānam could remind us of the Kalisthānam and Tretāsthā-

nam recognised by Nidānasūtra. The last three (h) Gurula-ghuvijñānam (differentiation of short and long) (i) Viṣamar-dhasamasañjām and (j) Yati including Samjñā² and Sampad have connection with both Laukika and Vaidika metres. But the first one is exclusively relevant to Laukika metre and the next four pertain characteristically to the Vedic metres. The incidence of number ten in Vṛṭṭaratnākara has a bearing in different way. It dilates on the units of the metres i. e. eight Trikas and Long and short—comprising Ten ganas. 3

The most noteworthy point that deserves mention is that Pingala made no direct treatment of "Vṛtti" in its two forms, Laghu Vṛtti, and Guru Vṛtti that determine the very nature of the Vedic metres. Absence of this direct treatment on this vital issue, which has been already recognised by the early predecessors has been defended by Yādavapra-kāśa⁵, the earliest commentator on the chandaḥ sūtra, who points out that this is due to the fact that Ācārya finds variation of this rule in many of the verses of the Veda. Practically speaking the very sūtras concerning the padasamjñā have been placed in such a way that the first two indicates Laghu Vṛtti and the last two the Guru Vṛtti. That Pingala could not discard this Vṛtti has been evidenced by the Sūtra Devatād itaḥ in 62 III. In case of any compli-

cation arising out of the confused nature of metre the Devatā and others will be essential factors for the determination of the pāda. Yādavaprakāśa lays down that by the term 'Adi', it signifies "Vrtti". But Halāyudha points out it has a bearing to the "Svara".

Pingala's chandah sūtra is written in sūtra style. rayl school maintains this tradition. Jayadeva introduces it in case of the Vedic metres but for Laukika metres, he innovates a new style in which the very definition itself becomes the illustration of the metre defined i. e. "Lakşyalakşmaņasamyukta" type of definition. Chandoviciti, adhyāyas of NS and that of Mitradhara adopted the method of "miśrikrta" having the definition and illustration in the same breadth. We could not definitely laid down that Janasray school has been developed even before Jayadeva but it is sure two aforesaid Chandoviciti are composed before 10th cent, because Abhinava.3 comments on the chapter of NS and the archaic feature of codex of the text of the Mitradhara4 indicates that it can not be dated later than 3rd century A.D. As there are at least three illustrative verses which this work has in common with the available text of NS, we can presume the NS to be the original source which is the innovator of this system, while Jayadeva and others followed.

It can be said in favour of this assumption that in some of the definitions of the Dhruvā metres (XXXII Ch.) this

method has been adopted.¹ Vṛttajatisamuccaya of Virahānka and Svayambhūcchandaḥ of Svayambhū are the two
works in Pkt² language, seemed to belong to this period and
obviously maintained the tradition by adopting this method.
It is noteworthy that the last named work out of reverence
for Skt. metrics treated it first just like the orthodox group—
such as the Pingala ch. sū Jayadeva and Agnipurāṇam have
chosen to deal with the Vedic metres in the fore front of
the text.

In order to make the definition handy and serviceable, Triads or Trikas, i. e., units of three syllables have been introduced by Pingala, who however retained Ga and La of the Vedic manual representing long and short³ respectively. In addition to this, fivefour metric ganas have been innevated for the definition of Aryā.

Bharata sticks to the simple though larger method of definition by specifically mentioning the nature of the syllables which are short or long in the body of the definition and advocated this system through the Anuştubh Stanzas. But as Bharata⁴ knew Trika form, in his chapter dealt with metrics, the nomenclature of these have been defined. And in his double set of definition⁵ metres under consideration have been framed in the definitions where the Trikas have

Laghuni guru vā kathita rajani II XXXII. 53. Gos. 145. But this
method is not strictly followed.

been applied. But this double set itself gives rise to the doubt about the genuineness of the Text. Abhinava seems to accept both of them as genuine which, in the face of it seems to be absurd. We, however, for our purpose leave out the question of the uncertainty of the text of the NS in this connection.

Jānāśrayī school, on the other hand, shows a system in which the Trika arrangement has been supplemented by the four syllabled, five syllabled and even six syllabled units. In addition to eight Gaņas of three syllables each, the author of Jānāśrayī has formulated eighteen units containing 2 to 6 syllables.

Vṛttajātisamuccaya and Svayambhūchandas do not use Akṣara Gaṇas but Mātrāgaṇas in both types of metres—Jāti and Vṛttam. But it seems that the idea of innovating mātrāgaṇas, being based on mātrās have been inherited from Skt tradition in which prescription has been made for four mātric Gaṇas.

Ratnamañjuṣā on the other hand employed Pingala's eight Trikas, but through other symbols. The manner of introducing these Ganas seemed to be the same. For an instance—Pingala laid down the sutra for the Trika "ma"—Dhī, Śrī, Strī—ma three long syllables are to be represented by "ma", the last consonant of the sutra. This technique has been adopted by Jānāśrayī school. But Ratnamañjuṣā differs from Pingala in adoptation of the symbol. For example the sutra—"Māyākā" has been represented either by ā or by kā which nothing but the Ma Gana. But Jānāśrayī faithfully adopted the method devised by Pingala. The eighteen quantities are represented in the sutra by the last consonant occurring in every one of them. In addition, in at least eleven cases, the initial vowel in Jānāśrayī is used to indicate

^{1.} Lah Samudrā ganah IV. 12. P. Ch. Sūtra.

^{2.} Sūtras 11 I. 11-35. chandoviciti. T. SS. 163.

each quantity. The last method is the innovation of the Jānāśrayī.

Pingala did not include group of Dvikas in the chapter of Samjñā, but he did mention it in the concluding chapter. That Pingala favours Dvika can be supported by the fact that in ch. sūtras the metres have been divided into three big genera—the Samānikā, the Pramānikā and the Vitāna. The first two groups have been arranged in Dvikas, in twos (Sl, IS)

Pingala speaks of the quantity of syllables but does not give any indication for the use of symbols or marks to indicate the quantities. NS too4 omits this topic. But in Jayadeva cchandas it is for the first time, the quantity of the syllables got their shapes. This perhaps the Jaina tradition that influences the subsequent works on Skt metrics to dilate on this issue. Harşata⁶, the celebrated commentator of Jayadeva describes Laghu as Sarākāra, as of the forms of an arrow. Jayakīrti⁷ marks Guru as Nāgara Vakra and laghu as the raised finger. Hema candra? reproduced the expressions of Jayadeva. This has continued to be the method of marking in the traditional code. Incidentally we can refer to manuals on non-SKt metrics-Vrttajātisamuccaya of Virahānka and Svavambhūcchandah. In the former a long is represented by a curve with straight lines at either end and a short letter is represented by a straight line.

Length of the both should be equal to that of the joint of the thumb. 1 Svayambhū too noted long letter as Vakra and short as Avakra, Rju and Urdha.2 The fact that Pingala has carried on the traditional Vedic view in the application of some sutra can be found in the introduction of the sutra "Gante"3-the light syllable at the end of the pāda became Guru. Halāyudha is perhaps the single person who seems to have sticked to the appropriate interpretation. That is why he opines that there being in the sutra as anuvrtti which goes against the prescription to be of compulsory nature4. He protests the noted predecessor Jayadeva who thinks that the rule is optional. But most of the subsequent writers do not subscribe to the view of Halayudha. NS with its lay out "Tathantyam ca laghu Kavacit", Janaśrayi in his sūtra "pādānte va"6 Jayadeva7 too advocates the view in favour of the optional use of the long. We should note in this connection Virahānka8 who speaks in favour of Halayudha and admits the compulsory sanction of the Guru in place of Laghu. Ratnamañjuşā'sº lay out too adopts this verson. But in the parlance of the Bhāşyakāra, the anuvītti of "Api" in previous verse indicates the Vaikalpika Vidhi. Ratnamañjuṣā however does not admit the lengthening of

the Laghu in the uneven pada of Aryā. Varāhamihira too lays stress on the optional lengthening of the Guru at the end of the pada only in case where the order of the prastara may not be hampered.

The case for the acceptance of the length of the vowels even when they are short provided they are followed by the conjunct consonant has been strictly taken up by Pingala and the orthodox school followed it. The author of Nāṭya tāstra¹, Jayadeva², Chandovicittikāra³ stood by the side of Pingala. Again, Laghu together with Anusvāra, Visarga and Jihvāmuliyopadhmānaiya are to be regarded as Guru. This has also been accepted by the Sanskrit tradition. Vṛtta-jātī Samuccaya too being within the orbit of the orthodox tradition speaks of the rigid rule regarding the length of the Vowel.⁴

Now we should dilate on "yati" which is a necessary concommitant in metrical composition. This yati is a special feature by which the Laukika metres can be differentiated from the Vaidika ones as some scholar thinks. "Yati" is not to be regarded as a regulator or controller according to derivative form "yamyate anayā"—as Karaṇa Vyutpatti but as a technique that has been regulated in specific cases—"yamyate yāsā". The last interpretation is more acceptable because the yati has been applied in restricted cases and not in all cases. And we should not perhaps be in the same side of those who are swayed by the idea, that the non-mention of this very term indicates the complete absence of this practice in the Vedic metres.

In the Vedic manual on metrics we are acquainted with

the term "Avasānam" whose function is to restrict the padatermination. "Avasāna" denotes in the Veda as the place the stopping etc. Śā. Śr. Sū. points out this haltage in case of the pada recitation being marked by the Panava. The Tristubh, Jagatī, Aksarapankti and Dvipadā would be recited through "pāda Avasānam" and this would be done at the end of the 2nd and the 4th. In Nidāna sūtra, in Rkprā. we meet with an elaborate treatment of this technique which in Śā. Sr. Sū. is sporadically treated. "Yati" in Skt metrics, on the other hand, lies in embryonic form in the Vedic metrics being termed as "Avasānam". The Avasānam is the 'terminus ad quom" of the pada, but yati is the dividing factor of it. That is why we find the regulation regarding the pada division.

Old traditional views were divided on the compulsory sanction of this issue. And the most noted among them who did not favour it are Bharata, Kohala, as much as the pionneers Māṇḍavya and Kāśyapa and the other group was ledby Piūgala and others—as has been referred to by Jayakīrti and Svayambhū.6

But most interesting fact is that Bharata favours yati, because, he defines it with other techniques and he employs it in the definition and illustration. Bharata however restricts its scope only to sense pause—"yatrārthasya samāptiķ syāt sa virāma iti smṛtaḥ". And all the verses illustrated

have been shown with the sense pause. And it is curious to note in no case NS deviates from this principle.

It may be that the NS deals with metrics in connection with dramatic performance and dramatic compositions only and in drama the sense is more important than the sound as the rasa is the sole concern of a drama. It is not unlikely that the NS did not bother about the metrical pause because it was not essential part of its deliberations. The sutra "yati vicchedah" in P. Ch. Sū is installed before the commecement of the Ch. VI. which exclusively deals with the Sarvasama vittam. Jayadeva³ told as Virāmah and placed in the chapter of Samjñā and paribhāsā, Jānāśravī4 too followed Jayadeva. The respective positions of the sūtras in these different manuals, seem to indicate the fact that in P. Ch. Su. "Yati" only concerns the Sarvasama Varna Vrttas, whereas the same in the respective chapters in those of Jayadeva and Jānāśrayī has been extended to the all sections. Like the Vedic metres Jayadeva prescribes yati for the padacatururdhava⁵ metres like Āpiḍa, Lavalī and Amrtadhārā. In placing "yati" for the metre suddhavirātarsabham6 at the end of the 1st pada and the next on the 4th. Javadeva maintains the link of the Vedic tradition with the Laukika ones. Jayakīrti8 and others only follow him.

The word Gāthā¹ occurs in the Rgveda several times. Sāyaṇa generally takes the term as equivalent to "Stuti" or "Stotra" and "Vāc". Elsewhere a Gāthā is called Purāṇi² being explained by Sāyaṇa as Pura Kṛtayā Gāthayā. This is of immense interest to us as it tends to suggest the fact that even before the time of the Rgveda, there was a floating mass of anonymous literary compositions known by the appellation of Gāthā.

In Sat. Brā, gāthā is used to convey almost the same meaning. To Yāska on the other hand, Gāthā is different from Itihāsa and Rk. In a passage of Ait. Ār. Gāthā is described as measured like Rk and Kumbā. Ait. Br. clearly distinguishes a Gāthā from a Rk and makes the distinction clear by saying that a Rk is divine while a Gāthā is human.

Speech in Brāhmaņas⁷ is regarded as consisting of both truth and untruth and it is the untrue speech that is current among the Mundane people. As opposed to this, the divine Vedic verses are regarded as containing truth. It is apparent that Gāthās being popular compositions came to be regarded as containing untruth. Ait. Br. lays down "Satya samhitā

RV.I.43.4a. Gāthāpatim. (Stutipā!akam—Sāyaņa)

^{8.} Ait. Br. I.6.

vai devāh anrtasamhitā manusyāh". Sat. Br. 1 too says— "Satyam eva devā anrtam manusyāh".

It is apparent from the given deliberation that Gāthā is a distinct kind of metrical literature, expressive of popular faiths and beliefs. Most probably it is contemporaneous with if not anterior to the Rgvedic period and was regarded as sacred as the Rgveda verses.² In the RV. X. 71, we find seers speaking of a number of people who cannot perceive the meaning of the Rgveda verses (uta Tvaḥ paśyam na dadarśa vācam uta tvaḥ śṛṇvam na śṛṇoty evām) and thus referring to only a limited few who could understand the same (uta tvasmai tanvam visasre. RV. X. 71. 4. c.).

It is quite obvious that there remains different literature in the Revedic age cropping up in different strata of the society.

It may be inferred that a steady and continuous addition to the stock of Gāthā literature was taking place, when the verses of even the latest origin incorporated in the body of Gāthā literature.⁸

Likewise Gāthā has been introduced in Chandah Vedānga as a distinct class of metre which has not been incorporated in the Śāstra.

It has been called as Śeṣa, i. e the rest—which are found in practice but not recognised in extant manual. A metre is Gāthā only in its relation to its own Text. It may or may not be Gāthā of other Texts. That is why we get two types of readings "Atrāsiddham Gāthā" and "Atrānuktam Gāthā." Halāyudha differs from two celebrated commentators Yādavaprakāsa and Bhāskara Rāya in accepting the last reading. His exposition runs thus—"atra sāstre nāmoddesena yanno-

^{1.} Sat. Br. I.1.1.4.

^{3.} Gāthā paramparā gatāh Ślokah Medatithi on Manusamhitā.

ktam chandah prayoge ca dṛśyate tad Gātheti mantavyam." But he restricts the scope of the same within the limits of the Sarvasamvṛtta only. Yādavaprakāśa, a contemporary with Halāyudha noted the wider application of Gāthā by restoring it in the reading "Atrāsiddham". By the expression Siddham he wants to mean what has been accepted by the Śāstra. By this very term, Yādavaprakāśa wants to differentiate the Śāstric elements from the non-Śāstric ones, just as the Barly dust (Saktu) is purified through a sieve (Titau—RV. X. 11. 2ab.). In its wider scope, the term Gāthā denotes not only the Rg verses but the Pkt verses found in the extant literature.

Bhāṣyarāja too breathes the same air so far as this issue is concerned and severally criticizes Halāyudha who made only the treatment of the samavṛttas. Bhāṣya Rāja's view extends further to a point which has hitherto been observed by none. His alternative explanation is to include "Gadya" under the section of Gāthā. This type of Gāthā resembles that type of the Vedic metres which has no pada division.

Jaydeva's manual³, for the fiirst time has an elaborated note on Gāthā where under the said term all metres other than four footed ones have been included. The lack of exposition in Harṣaṭa's commentary on this portion gives rise to the question about the authenticity of this sūtra.

Jayadeva VII. 37. Vişamakşarapādam vā padarasamam daśadharmavat Tantre'sminyadasiddham Gātheti tatpanditairjñeyam.

Jānāśrayī tried its best to explain its scope more lucidly and provided three sūtras for it. In its wider scope, Gāthā will include all the Vedic metres, four footed metres found in the usage of Şāstrāntara and the metres other than four footed ones. The last two sections have been designated as Svajātīya and Vijātīya by the anonymous commentator of this text. 2

Jayakīrti perhaps has an access to Jānāśrayī and made an attempt to differentiate Vijātīya from the Jātigāthā. In Jayakīrti's parlance, however, the Jātigāthā is that which has equal number of syllables in each pada of sixfooted metres and Vijātīya Gāthā is that which has unequal number of metres in the four padas of Anuştubh.

Ratnamañjuṣā uses the epithet "aprasiddhā" for Gāthā. Like that of Yādavaprakāsa, the exposition of this commentator means to say that "prasiddhā" conveys the same meaning as does the word "Siddham". In the extant manuals there are three types of regular and codified metres. Under this scope all the metres, i. e. the Vedic, the syllabic and the metric have been included. Outside these all other metres that are current in contemporary literature but not recognised in the standard manuals are to be regarded as "aprasiddhā", hence as Gāthā. 5

Kavidarpaņam, "the mirror of poets", a work by an anonymous author is of opinion that only those types of metres which were in vouge in his time but were not recognised in Sāstrāntaras are to be classed in the type known as Gāthā. This is to include those which have unequal number of syllables in their padas, which have more or less number of padas, than have been prescribed by the Sāstra and which are the Rūpakam or the Mātrāchandas.

In contrast to the Vedic pāda, Laukika pāda has been represented as the quarter of the verse. That is why just before the treatment of the Laukika metre, the sūtra "pādascaturbhāgaḥ" has been in P. Ch. Sū. Halāyudha interprets the term to mean the quarter of the verse and by this he excludes the Udgātā and Padacatururdhva class. But Pingala's definition should have to be applied in wider sense.

Pāda is here meant as the one of the parts of the four. That is why the fourth part of the Padacatururdhva metre has been described as Pāda. But the pada in the chapter dealing with the Vedic metre means to be applied to the constituent elements or limbs rather than the quarter part of

the verse, as has been allowed in pkt tradition. This is nothing but a well thought extension of the definition of poetry as catuspadi to five footed and six footed. Almost in the same sense, Jayadeva's scope of the sūtra "Pada" has been extended. That is why he does not need another sūtra for Laukika metre. Bharata's definition of the pada as quarter of the fourfooted verse indicates the yati at the end of the pada.

Almost in the same sense, the term "Pada" in the sūtra "Trişu ganeşu pādaḥ", has been used. Jānāśrayī which deals with only the Laukika metres admits the definition of pada to be the quarter of the verse. In this connection it can be shown that in its wider perspective, only fourfooted mātrā metres have been dealt with Jānāśrayī has no eightfooted mātrā metres. What we have got as śīrṣaka etc. are only strophies of two different Pkt metres.

The order of the subjects treated in Pingala is Vaidika-Āryā, Vaitālīya, Vaktra beginning with Samāni, Pramāņi and Vitānam, Viṣama Varṇa Vṛttas—Ardhasamam and Sarva samam. The order of NS. is somewhat reverse—Sarvasamam—Vaktra—Ardhasamam—Viṣamam and Aryā. This has been faithfully followed by Jayakīrti. Jānāśrayī school on the other hand maintains broadly the order of Pingala. Jānāśrayī introduces its subjects with Viṣamavṛttam keeping the treatment of Samāni, Pramāṇi and Vitānam at the beginning. This is followed by Ardhasama. Sarvasama and the Jāti Vṛttas.

^{4.} Jānāśrayī—I.8. T.SS. 163.

Jānāśrayī—V.57. Śirşakam Gītikaparā, when Adhikākşara is added with Gītika it is called Śīrşaka.

Ratnamañjuṣā's mode of distribution of its metres into different sections follows Pingala's way more than that of its school. It begins with Ardhasama metres of both mātrā and varņa types. This is followed by other mātrā metres. Viṣama type of varṇa vṛttas, Sarvasama vṛttas have been introduced with Samāni, Pramāṇi and Vitānam—the three big genera which means to represent all the vṛtta metres.

Jayadeva is the blind follower of Pingala in the distribution of his metres, as well as of Agnipurāņam. Vrttajāti--samuccay and Svayambhūchandas follow the steps of Bharata. But in his emphasis on some fundamental principles, Jayadeva differs from Pingala. Chandasūtrakāra made a treatment of the metres Samāni, Pramāņi and Vitānam as three big genera. Metres consisting of the sequences of long and short would be included under the head Samani, the short and long under the class Pramāņi and the Vitānam where any other arrangement is followed. The positions of these sutras at the commencement of all kinds of varua vittas obviously means that the divisions are intended for all the three types of varnavīttas - the sama, the ardhasama and the visama. But Jayadeva seems to be the first writer to annex the word "Anuştubhi" to the sutra of samāni. By this manipulation Jayadeva has made all the three terms Samānī, Pramāņi and Vitānam applicable only to the metres of Anustubh. This has been accepted with appreciation by Halayudha who interprets the sutra by supplying the word "Anustubh" from the sūtra "Pādasya Anustubh Vaktram" in the manner of the maxim "Simhāvalokita", or the lions glance.2 Yādavaprakāša a contemporary with Vrttikara laid down the real intention of the chandahsūtrakāra. Bhāsyarāja echoes in the same

breath but adds further what is not generally accepted. It points again to gadya. I Jānāśrayī and Ratnamañjuṣā, in their sūtra texts follow the manner of Pingala. In its emphasis on the treatment of these sūtras they stood in the same ground with Pingala.

The only noticeable difference is that Jānāśrayī and Pingala introduce these threefold divisions at the commencement by the varṇavṛttas, thus meaning thereby that these authors intend the threefold classification for all kinds of the varṇa vṛttas—Sama, Ardhasama and Viṣama. vṛttas. Ratnamañjuṣā on the other hand, places it before the beginning of the samavarṇa vṛttas. But the vṛttis on the same mean to extend its application to all varṇa vṛttas. Another distinguishing feature in Jānāśrayī's treatment pointed out by vṛttikāra of this text is that the Samānam class of metres extends its scope towards those metres which have the same type of syllable i. e. either all longs or all shorts throughout the verses. 4

^{2.} According to illustration given on the sutra II. 3. Jānā. verse (1) with eight syllables. verse (2) with twelve syllables.

On Sutra V.I. Ratnamañjuşā—Gāyatryādişu Utkrtiparyavasānaşu chandahsu pādaśah a padaparisamapteh lāli iti nyāso bhavati, bhavati samānam nāma......Etat jāgatyam chandasi tathā anyesvāpi chandādisu.

^{4.} Athavāyamanyo'rthah.....Bha ityeva Sarvanyakṣarāṇi sarvasya chandasaḥ Pravṛttāni bhavanti cet tad vṛttam samānasamjñam bhavati. Tathā ba iti ca pravṛttāni cet. On the sutra 112. under this Jānāśraya puts two illustrative verses having all longs and all shorts respectively.

According to these authors, the word Vitānam is a class name and not the proper name of a particular metre. Halāy-udha who differs from these host of writers does not consider Vitānam as one of the variety of Anuştubh class. But the latter writers like Jayakīrti and Virahānka think of the Vitānam as the proper name of a metre belonging to Anuştubh class. Kavidarpanam, however, while treats samānī and pramānī as the proper names of the Anuştubh class of metres, considers vitānam as a generic class. On Brhatsamhitā⁴, Utpala defines vitāna as a metre of Pankti class.

From the given deliberation, it can be estimated that the Samānī and the Pramānī having Iambic and Trochaic rhythm inherited from the vedic verse are regarded as the generic classes of those specific rhythm. Vitānam, on the other hand, having rhythm of the Trika is to be applicable to any kind of metre formed by the Trikas. But with the passage of time, the conception of these Dvikas has been abolished and it has been merged with the Trika system. That is why after Pingala when the last tinge of the Vaidika metre has faded away, the three big genera have been treated as Anuşubh class specifically.

The Visama Vittam in the treatment of Pingala includes the Vaktra class which is the best known of the Skt metres. It is really a class name of the metres of the group Anuştubh as it contains thirtytwo syllables without an uniform restric-

tion to the use of syllabic quantity throughout the four lines. The earlier part of the foot is lax and loosely linked from the view point of the quantity of the syllable, a legacy handed down to the Laukika metre by the Vaidika metre. This is Vaktra, because it is the face or visage of the whole Laukika varua metre. Bhavabhūti's encomium on the manner of descent or the manipulation of Śloka metre is in no way an inapt appraisement.

There have been allowed varieties thereof in the forms Pathyāvaktra, Viparītā Pathyā, Capalā vaktra and Vipulā vaktra, which are culminating to the formation of śloka form.

In Pingala's sästra this form is totally absent. In the Vedic literature, this word has been used in different senses. Nirukta² reads it as the synonym of the speech, of the Anuştubh. In the Rgveda, it is a call, or voice of the God³, sound or noise.⁴ Later it is used in the sense of strophe⁵. In Rāmāyaṇa, it is a verse born out of sorrow⁶, which has been echoed by Anandavardhana "Ślokaḥ Śokatvamāgataḥ." Jānāśrayī and Ratnamañjuṣā following Pingala's lead, deal with the vaktra group. But the manner in which, Jānāśrayī and Ratnamañjuṣā treat, has slight difference from that of

Pingala. In the chapter of the Viṣama Vṛttam, Vaktra group has been placed after Padacatururdhva, the Udgātā group being the first. These three groups are treated in just the opposite order by Pingala, the Vaktra group being the first and the Udgātā group being the last. Neither Jānāśrayī school nor Bharata make special treatment of the metre Śloka. Some speciality can be noticed in the treatment of Bharata. Vaktra class however has been appeared as Ardhasama and Viṣama type. But in its emphasis on the fundamentals it does not deviate from that of Pingala. From the Ist syllable there should neither be anapaestus nor betribrachys. But there should have a Laghu after the 4th Syllable. 2

Bṛhatsamhitā seems to be posted as first in appropriating the Ślokametre with its traditional definition. Svayambhū⁴ like a faithful follower of the Skt tradition, not only corporate the vaktra class among the Viṣama Vṛttam, but also appropriate Śloka metre with its wellknown definition. But Virahānka's Śloka metre is the metre of the Anuṣṭubh class, it could have its treatment among the Viṣama vṛttam, if there is a provision for the said class. Jayakīrti too deals with the śloka metre in the manner hinted in the Rāmāyaṇa after a full treatment of the Vaktra class in the manner designated by Pingala, i. e. defining the Viṣama Vṛttam.

in the ascending order of the number of letters occurring in the first lines of their representatives.

Another legacy from the Vedic metres was "Upajāti metre" which has been treated by the prosodists as a class-rather than a specific metre. This is the case of mixed metre, in the sense where one foot uses one pattern, the other a different pattern. From Pingala down to Jayakīrti, this is restricted only to 11 syllabled metres. The varieties in connection with this have been enumerated as $14(2^4-2)$ according as the opening syllable is short or long. Jayadeva seems to be the first to hint at the possible varieties and to the ceasura of this metre, extending its scope to only akin (Sājatiya) varņavīttas not to promiscuous varņavīttas (vijātīya).

Unlike Piṇgala, Jānāśrayī school gives it different designation, Indramālā, i. e. a series³ of Indra. This school, perhaps, would have considered the term Upajāti to be applied to Mātrāvīttas⁴. This tradition however has been supported by Jayakīrti⁵ also. Virahāṅka calls it by the name of Miśra.⁶ But it is interesting to note that following Piṇgala, all these authors⁵ are not swayed by the idea to extend the

connotation of the term to all metres whether of the same genus or not. Kedārabhatta claimed to have been the earliest writer for the next jone to note this development about which we will speak in subsequent paragraphs.

Pingala conceived of Arya as consisting of two hemistich which is obvious from the use of word 'Ardha' in the definition. 1 Bharata recognizes Pingala's tradition by the admission of the 'Ardha'.2 In the definitions of Janasrayi we have the same term. Ratnamañjuṣā4 incorporates it in the chapter where the entity of 'Ardha' occurs as a relevant item (as an Adhikārika Vastu). Practically speaking, Āryā with gaņa system comprising two hemistichs is of purely Skt origin. Therefore, it belongs to the orthodox group. Vis. within the orbit of this group defined Aryā in a manner of Skt tradition. 5 From Pingala's definition it is not clear whether the ardhagana (half of the four matric gana) will have only ga or two laghus inform. In order to clear this ambiguity, Jayadeva laid down that there must have a ga in form of ardham. By conversion of two ardhas, Pingala prescribes for two varieties-Gīti and Upagīti.

Svara ardham cāryārdhamiti sūtrena ganārdhasya dirdeśordhaceti pādena kryate. Tacca gurorladvayasyacanugamārtham.....Bhāsya-Rāya upholds a peculiar theory that this ardha may be in the form of two shorts. That Halāyudha does not subscribe to his view is obvious from his comment on IV.42 and his illustrative verses for Āryā varieties. Yādavaprakāśā avoids this issue.

These too have been incorporated by Virahānka in his manual, where he acknowledges the authority of Pingala. Varāhamihira in the section designated as Chandovicitivitta samgraha appropriated Āryā and its variety as consisting of two ardham. From the special object of this particular chapter, being that of illustrating the various forms of metres prevalent in his time or first introduced by him, we may presume that it was probably based on a particular treatise on metrics on which this astronomer can claim authorship. He does not give the definition of the metres, but they are indicated by Utpala, the commentator, who seems to follow the traditional method, as found in Jayadeva.

Divisions of Aryā on the basis of the manner of placing ISI Gaņa in the 2nd, 4th are the innovation of Pingala. Bharata, Jayadeva, Varāhamihira, Jayakīrti. Ratnamanjuṣā and Jānāśrayī appropriated to their respective manuals.

It should be no exaggeration to say, that Bharata¹⁰ was perhaps the earliest authority to note the pada division of

the Aryā by installing the Yati after three gaņas, i. e. twelve mātrās. Chandānusāsanam of Jayakīrti¹ and the Gāthā Lakṣaṇam of Nanditādhyay² being supposed to be the products of the transitional period made provisions for two types of definitions. They do not deny Pingala's authority by the admission of the gaṇa system and the ardha feature in their definitions. But at the same time, introduced the moric system in Gāthā.

Kavidarpaņam³ places Gāthā (Āryā) under catuṣpadī, though the manner in which it has been defined, speaks of the gaṇa regulated Āryā comprising the two halves. Even in manuals⁴ of the above mentioned authors, Capalā varieties can be found which seems to be absent in the Pkt tradition.

Pingala followed by Jayadeva treated Vaidikam and Laukikam metres. Among Laukika metres, Jati has been forestalled by Pingala⁵ but has not been distinctly incorporated in theory. Jayadeva⁶ adopted the same method. It is in the manual of Jānāśray¹⁷, two fold divisions of Laukika metresappeared with their well-known designations—Jāti and

vṛttam. Jayaklṛtil who had an access to Jāṇāśrayī lays down in very lucid manner, the two types of Laukika metres grouping them under Jāti and Vṛttam. This Jāti class includes, Mātrāsamakam, Vaitāliyam and Dvipadī Āryā type of Samskṛta, Galitaka type of Prākṛta and Śīrṣaka type of karŋāṭaka.²

It is an interesting fact to note here that according to the traditional metrical conception of the Vedic perlance, "Chandas" was an essential limb of the Vedic lore (Vedāṅga) and therefore it was in the fitness of things that the chandas should cover both the forms of composition, prose and verse. Pingala's inclusion of the Yajus⁸ Mantras under the scope of chandas hinted at the idea that every composition of religious type in the Vedic age follows a manner of rhythm. which is in its very essence one of the aspects of external requisites. But in its treatment with Laukika metre Pingala leaves out the prose from the scope of metre. This lost thread seemed to be found out by Bharata4 who recognizes the delectableness of appeal to the ear of the every uttered word and his division of gadya in connection with his treatment of metrics evinces clearly his recognition of the prose forms of composition within the fold of metrics.

Jayakīrti also realised the fact that if long metres like the Daṇḍaka can appeal to the ear, there is no logic in barring out the fluent and elegant prose from the scope of metre. That is why he picks out Bharata's "Curnapadam"⁵

and incorporated it in his manual. Looking at from this standpoint it becomes evident that the only difference that lies between verse and prose composition is that former is regulated by the pāda division while the latter is not. This particular topic receives an elaborate treatment in the hands of late century authors of Skt manuals and we shall discuss that topic in subsequent chapter.

Among the Varņavīttas, Pingala does not define metres having less than six syllables in a line. Jayadeva does the same but Bharata recognises² the metres from the ukthā class but incorporated from the atyukthā class in its Dhruvā chapter.³ Ratnamañjuṣā,⁴ unlike Jānāsrayī follows Pingala faithfully. Jayakīrti, however sides Jānāsrayī whom he acknowledges in many ways.

In theory, however, a large number of different kinds of metre were possible. The exact number of the possible metres that might be employed, can be known through the process of permutation and combination. This has been called "Vidhi" by Bharata⁵—"Pratiyante jñāyante arthāh ebhiriti pratyaya jñānam. Pratyahadhīnasapathajñāna viswāsa heturītyamarah—". The process by which the particulars about metres are known, are called "Pratyayah". Nārāyanabhaṭṭa⁶ explained it in a much lucid way. Having discussed all the vṛttas beginning from sama etc. he introduces that in order to know the full particulars about the

metres, some of which are found in the practice, we should have a fair knowledge of the six pratyayah. The possible number of metres would be sanctioned through these processes.

These are six in number—prastāranastyuddistha laghavādi krya samkhyā and Adhvojoga.

Prastāra — Prastaraņam prastāra bhāve ghan prastaryate iti prastāra. 1

Prastaranam² vitānam i. e. spreading out of the various forms which a metre can assume. Vjs. also includes under this head, spreading out of the figures and the number of short and long letter in these forms. It is a curious phenomenon that can be applied to any branch of śāstra—"Tatra prastāra protyayo nāma Samasta Vrttasamkhyā šilpavišesajñānam."

Abhinava too lays down—prastārastatra Samkhyādi Sarvamiti Samsrayasabdenāha tadganasamvijnānācca : prastāropyucyate.³

Nastam - 'gatam' nastamiti, Svarupenaiva na jñātam' - by this process the unknown structure of a particular permutation of a metre, can be found out, the serial number being given.

Uddistham - pretham is that which is svarupena jnatam na samkhyaya. The structure of the metre being given, the serial number of the permutation is to be found out.

Laghukriyā is on the other hand the process by which one can find out the number of structure with a certain number of laghu or guru i. e. to know how many structure were there with one laghu etc.

The Samkhya is the method for getting out the total

number of structures of the permutation (Samkhyanapratyayo nāma prastāram vināpi tattacchandasāmetavanti vṛttāniti vṛttasamkhyā pari jñānam).

The sixth is the space occupied by the permutations of a metre. 1

It would not perhaps be out of place if we incidentally speaks of the fact that the Vedic seers, also applied some sort of process of permutation and combination. But they have no theoretical knowledge of them. Given pada arrangements are enough to show how this process of permutation occurs in the Vedic metres:—

A stanza of two lines:

8.8.—Dvipadā Gāyatrī—IX. 67. 16—18

8.12.—IX.109.22; X. 172.3.

12.8.—Dvipadā Śatobrhati VIII.29.

12.12.—Dvipadā Gāyatrī VIII.46.13.15.

This is just like prastara of two syllables like guru and laghu. We have an exactly similar phenomenon in Sangitratnakara², where the same terms are used and the same process has been followed. We need not enter here into the details of the practical demonstration of these but we may briefly indicate the manner in which they are treated.

From the available editions of the Pingala Chandasutra, it can be ascertained that Pingala omitted the sixth item "Adhvayoga". Halāyudha was aware of this process but

he did not incorporate it in the Text as the Sutrakara did not want to introduce. 1 Having realised the importance of this item, Yādavaprakāśa² and Bhāskararāya8 claimed that this has been dealt with by the sutrakara through the introduction of the sutra "Ekenodhva". Their views have been placed with appreciation by Prof. S. P. Bhattacarya who strengthened it by adducing the cases of Jayadeva, Agnipurāņa, Virahānka, Jayakīrti even of Jānāśrayī who dealt with these six pratyaya in its every details. Velānkar on the other hand, noted that Pingala has treated only four pratyayas. It will be convenient to examine here briefly the sporadic treatment of the first process "prastara" in connection with the working out of the conceivable number of the Sarvasama, Ardhasama and vişama vettas in Pingala's chandah sutra,6 which has been dealt with before the commencement of the chapter V (Sūtras 3-5). Jayadeva carefully avoids this. Bharata included it under the section of pratyayas. Chandovicitti is more methodical and enumerates briefly the total number of sarvasama, ardhasama and visama vittam and dealt with them in the section of Samkhya (VI. 25 – 26). Ratnamañjuṣā appropriates it but Jayakīrti following Chandovicittikara discusses this in the section of Samkhyā (VIII 12). Later works completely omit this topic. The another relevant point in Pingala's treatment is that he does not enter into technicalities, nor he gives any designation to them. After Pingala who enumerates these pratyayas "en masse", it is Bharata who begins first by

naming and defining them. Bharata, however, does not include the sixth item. Excepting Ratnamañjuṣā all the works on the metrics in the orthodox group have the fullest treatment of these six pratyayas, with their significant designations. In Ratnamañjuṣā there is no acknowledgement for the sixth pratyaya nor even the designations of the other five pratyayas have been given.

We would close the survey of this orthodox period adding a few notes on a work of carnatic prosody, viz. Chandambudhi of Nāgavarman. Chief interest of this author is to provide place for Skt metrics, as he accepts Pingala's work as a guide 1 as his own mother tongue is one of the fifty six bhāṣājātis born out of the three main languages Skt, Pkt and Apabhramsa. In the treatment of the fundamentals Nāgavarman is more orthodox in spirit than Jayakīrti who in a separate section makes provision for Bhāṣājātis. He unlike the latter does not recognise the license in allowing a light to be metrically heavy before a double consonant the second part of which is Repha.2 Nagavarman appropriated many syllabic metres adopted by Bharata and Varāhamihira on one side and on the other side he introduced many new ones which are mainly corporated by the southern prosodists like Jayakīrti and Hemachandra.3

Verse XXII. ed. by Rev. F. Kettel. 1875.
 The commencement of the chapter V (Sūtra 3—5). Jayadeva carefully avoids this. Bharata included it under the section of Pratyayas. Chandoviciti is more methodical and enumerates briefly the total number Sarvasama, ardhasama and vişama vṛttam dealt them in the section of Samkhyā. (VI. 25-26). Ratnamañjuṣā makes a treatment (VIII. 6-9) but Jayakīrti following Chandovicitikāra discusses them in the section of samkhyā (VII.12). Later works completely omit this topic.

Nagavarmā—Vijayānanda ;=Bharata, Pravaralalita ; Jayānanda — Hem.II.273. (XVI.74)
 Nagavarmā—Drutapada = Varāhamihira. 130 20 etc.

The peculiar metre created by Bhatti in his Kāvya¹ has been corporated by Nāgavarman in his manual under the designation Hamsamattā, which has been slipped from the eyes of the Skt prosodists. Like Varāhamihira, Nāgavarman dealt with the metre śloka, being a species of Anuştubh.

From the given deliberation, we have a brief resume of the history of Skt metrics beginning from Pingala and extending upto Kedāra. This can be designated as the Orthodox period. During this period we see that the ultimate standardisation of the more or less complete shape of the doctrines of Skt; prosody has been outlined. The works of the period which follow this, apparently contribute nothing new but summarise and setforth, the result of the earlier speculation. The last tinge of the Vedic metrics is faded away from one side and to the other side has been admitted the non-Skt metrical principle conforming to the need of the age.

The period under review may be designated as the postorthodox period, about which we will speak subsequently.

Polymath Ksemendra deserves to be mentioned here for his appearance in the orthodox period as well as his special treatment of the metrics in his text book Suvetta Tilakam. This work generally reflects the character of the kavišikṣā, a class of work in Sanskrit, professed to show that they are for the guidance of the aspiring post. This type of work displays emphasis on one aspect of metrics as a discipline, namely, its practical application which developed side by side with the theoretical consideration of general principles.

Along yati, regulation of Akşara and mātrā have been the technical determinants in different periods, sonorousnesshas been proved all along to be their essential feature.

The Indian poeticist's conception of the Sabdaguna

^{1.} Bhatti XXII. 35.

Samādhi¹ (expressional adjustment) and uddārta (gravity or sobriety compiled with sublimity) point to the role of the metres in the function of the verse composition through their akṣara arrangement.

The Sonorous effect (sravyata) is held to be the joint product of the bilateral efforts of the post and his reader. The poet by his instinct and the reader by his receptive ear impart the quality of sonorousness in appreciation of a metrical composition.8 Devesvara, the author of the Kavikalpalata, warns the poet for the proper use of vati which may breach the essentials of harmony and symmetry. Poeticists also diates on the fact that versification is bad if it is undelectable to the ear even when the rules of versification have been complied with.4 Ksemendra practically lays stress on this śravyatā in the poetical composition only when there are possibility of the formation of a number of metres. Mechanisation of certain rules of definitions is no teaching at all; what is sravyata is marman (the vital part) of the metrics and has to be understood by proper recitation and by the close study of numerous specimens in literature. At the same time, to depict the rasa it is necessary to observe the rule of propriety. This may have application with reference to verbal concordance in the metres-appropriation of certain metres to the subject matter depicted in the verse.4

Kāvyālamkārasūtravṛtti III.1.13. ed. by Nagendra. 1954. Ārohavarohakramaḥ Samādhiḥ.....Tatrarohapūrvako'varoha yathā—Nirānand.....etc.

^{2.} Kavikalpalatā /—Evam yathā yathodvegāḥ Sudhīyam nopajāyate ... Tathā tathā Madhuratānimitham yatirişyate //.

^{3.} Hatam Lakṣaṇanusaraṇe pyasravyamapraptagurubhavānta Laghu rasamnugunañca vṛttam yatāt hatavṛttam, Kāvyaprakāśa VII. P. 334. Ed. Jhalkikar, 1950.

A. Abhinava in his gloss on XIV.105 dilates on the point that one Kātyāyana, who is presumed to be one of the earliest known writers on kavišikṣā, reflects on this issue; śarīrāśrayetyādi athoktam Kātyāyanena "vīrasya bhūjadandānām varnane srag-

The first chapter dealing with the general principles of metrics enumerates certain selected group of metres. Then he deals with praise and ensure within his limits as a true critic; in his hand even the honoured names of poets make no difference. In many cases his illustrations place two sides of a question regarding both merit and defect by different verses even from his own work. Sikharini in the hands of Bhāravi, obtains a special charm, but sometimes loses its real nature due to want of the compound word, other conditions remaining the same. The division of Sārdulavīkridita line is more agreeable, if the first half is more detached than the 2nd.

On the other side, Ksemendra places the cases of the poets who have been singled out for their proficiency in the particular metre.

In the concluding section of the chapter II, it deals with an interesting topic how the certain parts of a particular metre can be converted into a new one by the process of adding or altering some syllables.

While thinking on the appropriate use of the metres, Ksemendra begins the chapter III by dividing literature into Śāstras, Kāvyas, Śāstrakāvyas—Śāstra effect in Kāvyas and Kāvya śāstra—Kāvya effect in Śāstras.

In Sastra for the attainment of lucid presentation Anustubh is the best, in Kavyas however different metres will be appropriated so as to be conducive to Rasa, in Sastra Kavya long metres are better to be avoided and in the Kavyasastra too the application of metres will be in accordance with the attainment of Rasa.

The work hardly put forward any special claim as a work of great theoretic importance. Its value exists not in substance but in its treatment of practical issue. Finally, it can

dbarā Bhavet Nayikavarņane Kāryam vasantatilakādikam. Šārdulalita prācyes" mandākrāntā ca dakşine //.

be said, what has been treated in this work Suvrttatilakam, is in keeping with true orthodox spirit which he does not violate even for a time.

We have now practically completed our survey of the orthodox period. But the above account of the orthodox writers must not be supposed to exhaust the invaluable wealth of the scholastic activities of this period. The scholarly works of the commentators, in which they fell back up on minutest details of their universe of discourse for fine distinctions, are no less important in this field. In this field, the names of Halāyudha and Yādavaprakāśa deserves special mention. 1

Halāyudha's Mītasañjīvanī is an exhaustive gloss, in which every passage of the original is noticed and interpreted in lucid language. Being orthodox in spirit Halāyudha did not transgress the restrictions of the orthodox rules. He deduces illustrations from the current literature, but we would not allow the non-Skt elements that are not vouchsafed by the text concerned, which fact evinces the inherent bias of the author in that Line. Halayudha's exposition on crucial points like those of "Gante" etc. is nothing but literal commentory which fails to meet the inquisitive queries of the ambitious students. That is why, in most of the cases he was uncritical and hypothetical, and he was adversely criticised for his lack of ingenuity. It is queer that Halayudha fails to see the true character of the three big genera - Samānī, Pramānī and Vitānam, which he grouped under the Anustubh class. He has been condemned by his followers for the omission of certain sutras in the original text. Halāyudha² has left out certain sūtras in the Vedic portion which has been observed by his immediate follower

Halāyudha—near about the last quarter of the 10th century, Yādavaprakāśa—middle of 11th century. For details see Suprā P.163.

^{2.} cf. Bhāşyarāja P.51a-otāni sūtrāni vrttikrtā vismrtāni.

Yādavaprakāša. There are some divergences in the readings of the sūtras in the texts of the different commentators. In addition to that, Halāyudha incorporated 18 sūtras (in VIII 2—19; which did not form part of the original sūtra work. He speaks of the sūtra concerning 6th Pratyaya, but does not acknowledge it as belonging to the original work.

The second great annotator is Yādavaprakāśa, who is not well known as a commentator on metrics, but is more known for his manysided activities, i. e. for his Vaijayantī etc. From his unpublished text it can be known that Yādavaprakāśa (Ms. No. Adyar. 9. 1. 22. 1—275) is more faithful than his predecessor.

Worth mention is his commentary on the Vedic portion which is very informative and lucid. It may be taken as a safe companion to the study of the Vedic chandas. Pingala has been represented by him as the expositor of the Vedic chandas and the illustrations adduced by him are very helpful and are meant for manifold attainments. In order to avoid the overburdening on the commentary in the Vedic portion. Yādavaprakāśa does not dilate on the issues which are not touched by the original writer (nanapeksitamucvate).2 But on the other hand he extends his recognition to the views found in the other sastras with a view to substantiating the authoritativeness of his own. That is why in his commentary, there is a long list of metres, which obviously belonged to other sastras utilized by him not accessible to us. These on the other hand, may be traced in the works like Jānāśrayī, where as Halāyudha's computation in comparison with it may be minor and limited. In the treatment of Laukika metres, Yādavaprakāśa has two broad divisions

Şaşthapratyayo'pyardhaparicchi thirityeke. So'tyalpatvāt puruşecchānuvidha yitvenāniyatātvācca noktah—Halā. on VIII. 34. op. cit.

of metres in general, whereas Halāyudha dilates on the three, i. e. Gaņa, Mātrā, and Akṣara. His treatment of mātrā metres, is in the line of Pingala dividing it into Gaṇajātis and Nirgaṇajātis. In a very admirable way, he threshed out and discussed the following issues:—role of metres in the vedic scope; relative analysis of vikarṣa and svarabhakti; the process of contraction and expansion as has been envisaged by Nidānasūtra; the laghu vṛtti and guru vṛtti not noticed by Halāyudha; process of Adhyāsa culled from the Vedic literature; the issue of the generic upajāti variety and the Gatha.

Lastly, like the Kavišikṣā poets, Yādavaprakāśa made a specific contribution to the practical aspect of classical metres. He laid special emphasis on the derivation of several metres of various length by applying many devices¹ such as the repetition of any number of particular gaṇa;² the repetition of any number of either of the constituents; the taking in, or away, of any number of short syllables, substituting it by long syllables;³ modification of a particular scheme with particular parts, other parts remaining intact, by adding or taking away as in the case of Mandakrāntā.

Such a work of outstanding merit neither is known to literary circle nor to the whole group of the later writers on metrics. But Yādavaprakāśa has been acknowledged and his views are acceped by Bhāskara Rāya⁴ with great honour.

To form a just estimate of the forces at work in the way of evolution of chandośāstra. Mṛtasañjīvanī of Halāyudha and bhāsya of Yādavaprakāsa are proved to be indispensable. The period under review may be designated as the post orthodox period. During this period we see that the ultimate standardisation of a more or less complete shape of doctrines of Skt prosody has been outlined.

The first and foremost writer of this class in the postorthodox period of Skt metrics is Kedārabhaṭṭa whose Vṛṭṭaratnākara, judging from its popularity and influence must have helped a great deal in finally establishing the theories of prosody in classical Skt. This work, purely classical in spirit sets forth its doctrines in purely Anuṣṭubhmetres (as has been done in purāṇam and other śāstras), applied the "lakṣyalakṣaṇa Saṃyuta" method in defining: the individual metres which were introduced by Jayadeva.

Direct treatment of the Vedic metres as well as of non-Skt ones are entirely ignored and we find for the first time a definite scheme of Skt metrics more or less systematically elaborated and authoritatively established. This work with the merit of fulness not only summed up the previous speculation made by Pingala, but in turn is declared to be the earliest orthodox Skt work in which underlying principle of the very vernacular language has been laid down. This work is aptly called objective, empirical and it is more or less mechanical in discipline.

In Kedāra's Vittaratnākara the classical Skt metrics are formulated not incidentally as in Bharata or in Varāhamihira, not sectionally as in Pingala, Jayadeva and Jānāśrayī but in such a well defined outline as would indicate that classical Skt metrics attained the rank of an independent discipline. The text has been commenced with the acknowledgement of the authority of the Pingalācārya.

^{1.} Pingajādibhirācāryairyaduktam laukikam dvidhā/mātrā varņavibhe-

As there is nothing to set forth a new in the orthodox line this attempt was to put his discipline with an appreciable nicety of arrangements and in a simple lucid language so as to be accessible even to a child. This work consisted of six chapters containing one hundred and thirtysix stanzas. In most of the works composed in this period, the fashion was to restrict their scopes within the orbit of the six chapters. Garudapuranam² accepts this mode of arrangement of the subject matter within the six chapters but not in the given number of stanzas, while Vuttodaya retains even the exact number of verses within the six pariccedas, but not the chapterwise arrangements of the subjects.8 Polymath Hemchandra4 though appeared in the same period, treats Skt, Pkt and Apabhramsa metres in his work Chandonusasnam in eight chapters. In twentyone ślokas Brhannaradiyapuranam⁵ dilates on the rules on Skt prosody, which appears to be orthodox in spirit but classical by feature. While enumerating on the rules of the six pratyayas, its adoptation from Vittaratankara is so faithful sometimes, that it can be charged for slavish palagarism, on account of the verbatim reproduction of the stanzas. Unquestioned dominance of Vittaratnakara is clearly discerned in the respective chapters of Nāradiā and Garudapurāņam. There is hardly any doubt that the chanda portion dealt in Garudapurāņam, is chiefly on workable epitome presented by a writer who conforms in essentials to the understandings of the theorist Kedārabhatta.

^{5.} Venkateśwar edition. Pürvakhanda. 75 Adhyāya.

To Vittaratnākara, sole credit will be given for recognizing the importance of the ten varņas¹ (in addition to 8 varņas representing eight Trikas, two others, ga and la representing solitary long and short respectively). But none of its followers took notice of it. This has been reproduced verbatim by Gangādāsa, the author of the Chandomañjarī in the succeeding period and this work we will take up subsequently.

The vowel that has become Guru by standing before a conjunct consonant which stands at the beginning of a line, is sometimes taken as Laghu. This verse has been incorporated in Garuḍapurāṇam² and Vuttodaya preserves this verbatim however in its own languages. Saraṇadeva³ who noticed this license enjoyed by the great poets like Magha etc. speaks of this in the form of a sūtra.⁴ The same has been referred to by Gaṅgādāsa who ascribed that to Piṅgala. Hemacandra exposes it in a very scientific language" "ka Pavisarg anusvarvayñjanahradisaṁyoge"—without leaving any condition that this has exclusively occurred in non-Skt languages.⁵ This is the tangible result of the contact existed between Skt and non-Skt metrics. This has been slackening practically the orthodox discipline where the irre-

gularities and the violations of the fundamental axioms of sastra are condoned but not directly encouraged. Kedāra's spirit of adjustment would not forego the old sastric leaven. At the same time, Kedāra understands that like Prayogasāstra, metrics is essentially practical and cannot as such brush aside the authority of the usage. That is why in the midst of the diversionary activities, Kedāra extends a just response to the spirit and manner of non-classic study. Direct sanction is however crystallized in the Chandonusāsanam of Hemacandra.

On the crucial problem of the issue² "Gante", Kedāra's-observation has got to be read with that of Jayadeva by adopting the optional application as has been entailed by sastric "Vyavasthita Vikalpaḥ."

In its treatment of Gāthā Kedāra placed two sets of definitions. The first type found to appear in the Samjñāvidhāna adhyāya's which includes verses composed of three and six padas within its fold, while the second has been specified by the term "Anuktam" placed in the concluding verse of the last chapter. Thus the Gāthās are of three types—one which have unequal number of padas—i. e. Padairasamamiti; second, which have different types of ganas in different padas of the metre; and the third which have unequal number of Akṣaras in each pada. To the scope of the last one, the pādacatururdhavādi may belong The last mentioned metre is the regular viṣama metre in Pingala chandaḥ sūtra. Therefore the definition must have the "ativyāpti doṣa". In order to avoid this, the second sūtra is codified-i.e. "Atrānuktam Gāthā." Gāthās are those which are not codi-

fied in the given manual. It has been asserted that Gāthās are those which are not defined here. 1

Vuttodaya² inserts the definition of Gāthā in a manner like that of Vrttaratnākara. But the author of the work reminds his own language i.e. Pāli, in which all the verses are called Gāthā.³

Garudapurāṇam⁴ avoids the double entry of the definition of Gāthā and places it aptly only at the close of the discussions of the Varṇa vittas.

Hemacandra's definition of Gāthā in this place, is appropriate to his style and possesses an all pervasive scope. 5

While leaving the matters of general concern to be explained in the premier chapter, Kedāra crams four different groups in the Ch. II namely-Āryā, Vaitālīya, Mātrāsamakam and Vaktra groups. In this manner of arrangement Kedārabhatta follows the orthodox line, adopting the system of Pingalācārya whose preference exists in such seriality—Āryā, Vaitālīya, Vaktra, Pādākulakam and Sikhā etc. Vuttodaya proves to be more systematic, more scientific than Vṛṭtaratnākara. Unlike the latter it deals only with the Mātrāvṛṭtas, leaving the Vaktra group only to be appropriated by the Viṣamavṛṭta parıcchedah. The peculiar treatment of Vaktra among the Mātrāvṛṭtas draws the attraction of a host of commentators and Trivikrama, the earliest of them,

justifies the name Samkīrņa Vrttādhyaya¹ of Ch. III of Vrttaratnākara by showing the inclusion of Vaktra group into that chapter. Along with Vaitālīya group the treatment of the Vaktra group is justified on the ground that in the former, as the Gaua system has been allowed there partially, so in Vaktra there has been the partial provision for the varņa gaua.²

But in a peculiar way almost like Jayakīrti, Kedāra deals with the Ardhasama and Visama vīttas, which he placed after Sarvasama Varņavīttas.

Hemacandra's approach however strikes a different note from those of his predecessors who crowd all these subjects under one Adhyāya, i.e. III which he treats after that of the Sarvasama vittas.

The Chapters III, IV and V of Vittaratnākara are solely devoted to varuavittas treated in 109 heads. The number seems to swell up gradually by the passage of time and each writer seems to add something to the stock of his prede cessor. So we see that Pingala's work recognises 80 varuavittas, Jayadeva 80, Kedāra has 109 and Hemacandra about 30).

Upajāti³, a generic name for Tristubh class devised by the orthodox prosodists headed by Pingala for the metre resulting from the mixture of Indravajrā and Upendravajrā.

and Atijagatī in Jayakīrti¹ extends its scope while Kedāra generalises it to any kind of admixture of metres irrespective of their classes.² Trivikrama in his gloss on this issue strikes on the right point what has been intended by Kedāra.³ Vuttodaya unhesitatingly adopts this in verbatim and Hemacandra agrees with this because it can be substantiated by the old usage. Yādavaprakāśa subscribes to this view but Halāyudha restricts the scope of such admixture to the Triṣṭubh class only.

In the true spirit of the orthodox writers, Kedāra treats Aryā which has been described by him as a metre of two hemistiches. But he appropriates the definition of Jayadeva, because, Pingala's definition by its ambiguity led to great deal of controversy regarding its interpretation.

So far as the spirit of Āryā is concerned, Kedāra holds strongly the line of tradition enunciated by Pingala. In no place, he gives even a slightest reference of the catuspadī Āryā, though at the close of the orthodox period we find "full fledged figure" of it in the works of Jayakīrti and Nandi tāḍhya. Neither in Vuttodaya, nor in Hemacandra this this is present what to speak of Garuḍapurāṇam.

The purely normative character of the Skt metrics begins to disappear with the ultimate standardisation of more or

less complete scheme of the classical metrics outlined in Vrttaratnākara. This stage is marked by great scholastic acumen, if not by remarkable originality but by its all embracing provisions for all "Sāstrāntaras". This may be called a stage of progress and adoptability in the one hand and on the other, this is a stage where very few novel ideas come up but only the old ones are recapitulated. There may aptly be called a stage of deterioration or decadence.

The manuals appearing in this age follow the lead of Pkt Pingalam, after the appearance of which there dawned a new era in the horizon of Skt metrics. In this epoch of fertility—the general principles being fixed, the manuals devoted themselves to speculate on the established theories in their minutest details for fine distinction and to cope with the new ideas with a spirit of adjustment. Consequently, varied, plentiful and novel types have been supplemented in new vein of thought, experiments were made to find a comprehensive formula to cover the old ideas as well as the new.

It covers the age of numberless commentaries which, made on the authoritative work Vrttaratnākara, are busy with the work of the annotation, expansion and restriction of the already established rules.

Side by side, we see that there flourished many popular text book makers who engaged themselves in the task of simplifying the science for easy enlightenment.

We would just make a cursory glance to the scholarly expositions made on the standard work Vrttaratnākara made by the commentators who flourished shortly after Kedārabhatta. They are Trivikramabhatta, Sulhana and Somacandrasūri. Trivikrama is the earliest and Sulhana is the most critical and presents the opinion of Kedāra in its proper

perspective and in the light of the traditional information vouchsafed to him.

On many places Trivikrama's exposition is plain, simple and literal whereas Sulhana's is critical in every detail and his opinion is very logical, that it removes away all the ambiguity of sense.

Trivikrama boasts that his attempts are not to explain the sutra in its every detail. He has expounded only those portions which seem to be difficult and his main purpose is to supplement Kedāra's information from texts like those of Jayadeva and others. He would interpret Kedāra's works so as to contain, wherever possible, also the information given by others by resorting to maxims like the Simhāvolokita and to avoid the defect of Avyāpti and Ativyāpti.

Sulhana seems to be more appropriate and critical, where he controverts the pādādau in 1.10 adopted by Trivikrama¹ and Somacandra.² The reading pādādau is not appropriate because the illustrative verse is in Aryā metre, whereas in Kedāra's parlance, there should not have any pāda division. If the reading pādādau is granted, it will contradict Kedāra's own conception. Therefore, Sulhana's exposition is more clear and more appropriate when he lays down that a short letter coming before a conjunct consonant existing at the beginning of a verse, does not sometimes become long by position. What is significant in this sūtra is that a short letter coming before a conjunct consonant sometimes does not become long by position. This position is created by the "Krama." Therefore, in all cases there should not be

optional¹ lengthening.

Again "Krama" may mean what has been granted and adopted by the great poets through the ages.² That is why Sulhana adversely criticizes Trivikrama who accepts the reading "pādādau" as the rule regarding the lengthening of the short at the end of the pada. Sulhana's observation is based on the practical usage which should be applied on the even padas. Vāmana in his Kāvyālamkāra is against the lengthening of laghu in the uneven padas.⁴

In the interpretation of Gāthā Trivikrama observes the view of Kedāra from a new angle which is still unprecedented. This signifies that the word "Daśadharmavat" has reference to the ten varṇas—Mara...etc, on which the whole of the metrical science is based and which composed the syllabic metres. In other words, this comprises all the syllabic metres and among them what are not included in the Sāstra are to be called Gāthā.⁵

Trivikrama is more a frank follower like Halāyudha than a critic and two others are eclectic. They may be fairly regarded as belonging to that group of faithful commentator who think it better to interpret literally than toincorporate new ideas in the system they comment upon.

In the manuals belonging to this period, we can notice four streams of ideas. The first group comprising Vani Bhusanam1 and Vittamauktikam2 in the spirit of the non-classical replenishes the necessities which were deficient. The second group which includes Chandomañjarī³, Chandokaustava4, Vrttaratnāvalī5 etc. is the recast of the surviving exponents of the orthodox tradition. Chandopiyuşa6, on the other hand, represents the textual criticism working out in the independent method of his own. In Chandonusāsana7 non reorientation of the fundamental principleof versification is found.

But all these divergent streams of thoughts and tendencies gather together in Pkt Pingalam under one clear, dominant and finally authoritative doctrine.

Besides these four groups enumerated above are Kavišikṣā. type of works like Mandaramaranda Campū and Śrutabodha8 attributed to Kālidāsa are purely classical in spirit but deals with other aspects of metrics as has been made by SuvItta tilakam and others. The standard work of this age,. is Pkt Pingalam⁹ which is written in Avahatta language.

It is maiely devoted to the Pkt and the Skt metrics. The work is important and indispensable for the setting up of the chronology of the Skt metrics, because this is the only work in Pkt which after the VIttaratnākara moulded the shape of most of the manuals that appeared in the later period.

Pkt tradition prefers quite obviously to deal first with Pkt metres. Virahānka, the earliest known work available in Pkt tradition seemed to be the originator of this method. Svayambhū's regard for Skt tradition strikes rather a discordant note in this domain. Pkt Pingalam follows the method adopted by Virahānka whose most of the layings have been incorporated by him. But unlike Virahānka, the former divides the manuals broadly into two sections dealing with Pkt and Skt metres respectively. Not only Vāṇī Bhūṣaṇam, but also Vṛttamauktikam¹ has been set in two parts each separately numbered as an independent unit.

Pkt Pingalam in the true spirit of a compiler attempts at rationalising into a systmatic and comprehensive system the already accepted methods of versification elaborated by the previous thinkers like Pingala, Hemacandra, Virahānka and Svayambhū. The compiler adopted the five mātrāgaņas² introduced by Hemacandra, used symbolic names for four mātrāgaņas of Virahānka³ namely 2, 3, 4, 5 introduced new mātrāgaņas t th d dh n and recognised eight varṇagaṇas of Pingalācārya. But so far as the definitions are concerned Pkt Pingalam used all the symbols introduced by the authors

I. O. 114 and Adyar 40E 39 describe only the Part—I. Part—I being completed in 52 leaves and Pt. II in 204 each of each has been separately dated.

just mentioned except his own ones³ i.e. t th d dh n. Vāņī Bhūṣaṇam² and Vṛttamauktikam following the track lay a side the Mātrāgaṇas of Hemacandra but use all the technicalities especially those of Pkt Pingalam. But unlike Pkt Pingalam, they dispense with the mātrāgaṇas of Hemacandra.

Poetical licence has been allowed to enjoy in Pkt tradition. The orthographical character of the syllables in the metrical lines are not restored rigidly. What is vague and slightly hinted at first in Skt manual Vrttaratnākara³ is carefully set forth in Hemacandra⁴ but is finally established in Pkt. Pingalam.⁵

To refer to the most conspicuous instances, we may point out the rules that ordain that (1) the short before a conjunct consonant need not necessarily be always long and the long, if recited as short should be regarded as short. Even if a syllable containing two or three mātrās be read rapidly, it should be regarded as containing one mātrā. (2) E and O which are metrically long in Skt tradition, have been considered as optionally long in Pkt tradition. Vāṇī Bhūṣaṇam adopted the 2nd rule of Pkt tradition but did not recognize the first one which Vrttamauktikam reproduces in Skt langu

age. In the treatment of the subject matter Vāņī Bhūṣaṇam follows Pkt Pingalam closely than Vṛttamauktikam which treats the metres Saveya and Galitakam in its every detail which however the former two, Pkt pingalam and Vāṇī. Bhūṣaṇam, omitted.

In Pkt tradition Gāthā is a mātrā metre, whereas in Skt it is a gaņa metre i. e. regulated by the caturmātric gaṇas.² Pkt Piṅgalam³ records both the definitions introduced by these traditions. In Vāṇī Bhūṣaṇam⁴ too we find that this metre has been treated. In the same manner Vṛttamauktikam separately lays two sets of definitions, by which it seems to afford respective criterion to Skt and Pkt traditions. Thus Gāthā is defined here as Mātrā and Āryā as syllabic one.⁵

Vāṇī Bhūṣaṇam and Vṛttamauktikam do not make provision for Capalā variety of Āryā⁶ which seems to be an innovation of the Skt tradition since the Pkt Piṅgalam seems to take no notice of it. Pkt Piṅgalam⁷, treats Upajāti as a class which is originated from the mixture of the metrescontaining the same number of syllables. Vāṇī Bhūṣanam⁸ notes only the case of Indravajrā and Upendravajrā. Vṛttamauktikam, however, restores the version of Pkt Piṅgalam by dilating on the point "Samaakkhara" and places the cases.

of the Śālinī-vatorņī, Indravajrā, Upandravajrā, Vamšastham-Indra-blamšā. 1

Lastly, without entering into unnecessary details, we can show that Vṛttamauktikam and Vāṇī Bhūṣaṇam though seem to belong to Skt tradition make no discussion about "Gāthātype" of metres being influenced that are not by Pkt Pingalam. On the contrary, Kavidarpaṇam and Hemacandra make a short provision for "Gāthā" as they belong to the post orthodox period. Hemacandra and Kavidarpaṇam can not abstain from doing it out of the reverence for Skt tradition.

Vittamauktikam deserves to be treated specially here because of its all embraceable scope. It not only gives places to Skt and Pkt metres, but incorporates all types of vernacular metres current its time, i. e. the 17th century.

Part—I which completed in 52 Folia deals more with non-Skt metres than with mātrā metres. These are syllabic matres but have been included in the chapter for mātrā metres. It is more extensive and exhaustive in its scope. It is for the first time we are acquainted with Saveyā² and Ghanākṣarī³ hitherto unknown in the extant doctrinaires. By their special feature these metres are more syllabic than matric and by their nature they are more Prākritic than Sanskritic, because they received an impetuous treatment in the hands of the vernacular poets and prosodists.

Part-II completed in 204 Folia, comprises twelve subchapters. It embraces all kinds of specimen of versification

^{1.} Fol II lla. Śālinīvātormyupajātih // anayorekatrapañcamakṣaragurutvadapartra ca pañcama laghutvadalpobhedayojanāt prastāraracanayā jāyanta ity upadeśah.

not recognised by others. Among these most interesting is the Prakaranam dealing with by Virūdavalī.¹ This kind of metre for the first time receives its recognition in the manual of versification. In the early stages, this has been called to the requisition for the purpose of panegyrics.² It receives its impetuousness in the hand of the Vaiṣṇavas and the verses are drawn mostly from the works of Rūpagoswāmī.³ It seems to be exhaustive in treatment and covers a total number of 62 Folia. In the definition, both the total number of syllabic instants and Varṇagaṇas are required. Its use can be found only in the Skt literature.

Pkt Pingalam, recognises neither Ardhasama Varnavṛttasnor Viṣama Varṇa vṛttas. Vṛttamauktikam makes provisionfor all these metres. Not only these, the Vaktra⁵ class of metre which we found in the traditional definition of socalled Śloka metre⁶ has also been dealt with.

The early work on metrics looked upon as Vedānga include all the Vedas within its scope which comprises both verse as well as prose forms of composition.

In the works of later metricists as well as poeticists, reappear the same idea as if they have been swayed by the

notion that if Dandaka¹ can have an appeal to the ear, there is no logic in excluding the elegant prose from the scope of chandas. Chandomañjarl is the earliest known extant manual to note down this theory and Vrttamaukti-kam² following it reserves a fair position for the treatment of prose composition and adduces instances from Mālati-mādhava³ and others.

Vāgvallabha, a comprehensive work on Skt and Pkt metrics, is to be placed after the above mentioned works on which the influence of Pkt Pingalam is obvious. Like Vīttamauktikam it does not lay aside, in its Varņa Vīttaprakaraņam, Ardhasama vītta, Viṣama Vītta and Gadya Prakaraṇam. In its all embraceable scope a distinctive place has been alloted to Capalā variety of Āryā, which Vāṇī Bhūṣaṇam and Vīttamauktikam do not treat at all. But it is interesting to note that Vāgvallabha makes a fair treatment of Vaitāliya Prakaraṇam which Pkt Pingalam and Vāṇī Bhūṣaṇam omitted totally. But unlike these three, Duḥkhavañjana Kavi in Vāgvallabha admits the scope of "Gāthā" that hints at the metres not included in the manuals concerned.

Mention may be made here of a similar type of workentitled Vrttacandrikā in which the influence of Pkt Pingalam is clearly discernible. Within a very short span containing only 23 pages Vrttacandrikā distributes its subjectmatter into three chapters. The first chapter commencing with Āryā metre, deals with nearly all kinds of Pkt metres-

Bhāṣyarāja 112b. Mātrāchanda dandakeṣvāpyamisur antarbhūta Prāsatālairviśiṣṭha iti.

^{2.} Fol. II. 133b. Vānmayam dvidhadam proktam padyam gadyamiti.

Yathā vā mālatimādhave Gato'mavalokitalalitakautukah kāmadevāyatanamityādi yathā va kābambaryām—pātālatalavāsisu dānavesvesvityādi //. Ibid. Idem.

like Soratha, Dohā, Madhubhāra, Kola, Cauvālā etc. Excluding Vaitālīya group. The second and third chapters mainly deal with Varṇa metres including in its restricted scope of metre Ghanākṣarī and Saveyā class of metres. Later on it has some dissertation on general topics to which has been added the definition of Gāthā "Gāthoktā caraṇaiḥ ṣaḍbhiṣṭathaiva caraṇaistribhiḥ." The discussion however is closed after a slight touch on Gadya.

A small unpublished work¹ of Sārangdhara Agnihotrīm consisting of nine and half folia belonging to 1700 AD also deserves mention here. From the brief exposition at the beginning it appeared that the work is purely orthodox in spirit. But in the treatment of the subject matter it follows Pkt. Pingalam. After defining Āryā in a manner followed by Pkt tradition, it devotes a few stanzas for Mātrāvīttas like Dohā, Catuspadī etc. This was followed by Sarvasama and Ardhasama Varna-vīttas.

Another unpublished work, named Vṛttadarpaṇam² of the last century can be referred to here. The work has been modelled after the fashion of Pkt. Pingalam. It enumerates briefly the rules as have been prescribed by the Pkt tradition. It gives no recognisation of the mātrāgaṇas and the host of the Pkt metres that have been dealt with in this work are defined in terms of mātrās.

It first deals with Mātrāvīttas which begins with Aryā and its variety and closes with Marahattavīttas. The second prakāša dilates only those Varņa vīttas which are treated by Pkt Pingalam. They appeared with the same designations as has been adopted by that standard work. The work closes with a fair discussion on prastāra including both Mātrā and Varņa prastāra prakaraņam.

^{1.} ASB, MS. No. I. G. 8. By name chandomālā.

 [&]quot;Codex" numbered as G.5915 contains only / section where as the complete work has been noticed by R. R. L. Mitra in Vol. VI. The number of which is 2028. P. 54.

Vṛttamauktikam only discusses elaborately the Mātrā Prastāra, shortening the case of Varna Prastāra in a few lines. The work concerned, like Pkt, Pingalam extends a full-fledged discussion on Prastara of both types of metres.1 In fact, the only difference is that the former shifted the topic at the end of the work following the Skt tradition. where as the latter inserts it between the Samijña Prakaranam and Mäträ Prakaranam.

We could place here another work on metrics, with the same designation by some Kavindra, son of Rāmānanda. The work appeared with chapterwise description in the notices made by R. Lall Mitra.2

The arrangement of subject matters exhibits the fact that the work is modelled after the manner of Vittamauktikam. Unlike the preceding work consulted before, it discusses about Pratyayas just after finishing the Samija Prakaranam. Unlike Vittamauktikam, we came across the Vipula variety. Vaitālīya Prakaraņam is preceded by a detailed discussion on Matravittas as has been executed by Pkt Pingalam and others. Along with Sarvasama Varnavrtta Prakaranam. Ardhasama and Visamavrttam have also been dealt with. The work closes with a fair treatment on Gadva and Virudavall being followed by a short note on blemishes arising in connection with verse composition.

The group of writers who claimed to be the surviving exponents of the orthodox period headed by Chandomañjari-

kāra may conveniently be mentioned here. Gangādāsa's-Chandomañjarī constitutes a compact manual on Skt metrics in six chapters. There seems hardly to have any ingenuous treatment. The work mainly based on Vṛṭṭara-tnākara not only paraphrased standard definitions, but reproduced sometimes the whole of the stanza verbatim¹. In the same hackneyed manner, sometimes in same phraseology Gangādāsa formulated the definition of Upajāti and of Āryāmetres.

The unavoidable influence of the Pkt tradition is inevitable on the group which comprises Gangādāsa and others. With a spirit of electicism, it pays due acknowledgement through the implicit sanction of the optional rule regarding the lengthening of the short before conjunct consonant. While utilizing the illustrative verse of Vrttaratnākara for the case of optionally lengthening of the short at the end of the pāda, Gangādāsa unconsciously shows his compliance with the Pkt tradition. Because the verse concerned is in Aryā metre and pāda division is accepted in the Pkt tradition. And the most curious fact is that Gangādāsa being the remnant of the orthodox period sets the definition of Āryā after the frame of two hemistiches.

But Gangadasa does not distribute his material in a

fashion after Kedāra, who follows Vedāngachandokāra basically. Instead of dealing Mātrāvṛtta after Samjñā Prakaranam, Gangādāsa introduces the chapter of Sarvasama vṛttam. In this case, his manner is in keeping with what has been planned in the respective works of Jayakīrti and Hemacandra whose distribution of subject matter is done in the following sequence—Sarvasamam, Ardhasamam, Viṣamam, and Mātrāvṛttas. But unlike the host of these authors of the Skt tradition, Gangādāsa leaves no scope for "Gāthā" or "Seṣa" type of metres. Vaktra class has been allotted a special place in his chapter on Viṣama vṛttam.¹ The work closes with the chapter dealing with Gadya Prakaraṇam but the discussion about Ṣaṭpratyayas is not touched upon possibly because, to this author it is nothing but a mere curiosity.²

Incidentally, we come across a work entitled Chandoma-khānta³ by one Purusottamabhatta supposed to be the master of Gaṅgādāsa.⁴ The work can distinctly be referred to here, because in it the Gitivitta has first received a vague but implicit sanction in manual on metrics. Many of his songs bear close resemblance to those of Jayadeva and they are laudatory verses addressed to Siva and Pārvatī.⁵

Chandoratnākara⁶, and elementary treatise on the Skt metrics in four chapters is a work belonging to this group. The work in 17 Folia is fashioned in its own way. Along with Aryā it deals with Dohā or Dohārikā for which our

Chandomañjarīkāra also makes some provision. Likewise some classes of Apabhramsa metres are found in this work such as Aninda, Mātrāmohinī, Cārusenī, Bhadrā and Raṭṭā with rhymed padas. Obviously they are expected to be used in current literature.

The author must have before him the work of purusottamabhatta, because it does not miss the Gītika metre². In its restricted scope the author tries to convince that Upajāti³ metre is not to be regarded as the species of Tristubh class, but to be treated as an independent generic group. That is why Upajāti has been dealt with separately. In a few lines the Şatpratyayas are discussed and the topic of Gadya has just been touched. Lastly, it can be said that work is being modelled in many parts after Chandomañjarī with considerable plagiarism of passage in extenso.⁴

Like the late century works, Chandokaustava embraces all kinds of metrics coming on the way, but as a remnant of the orthodox group, it imbibes the spirit of Vṛṭṭṭaraṭnākara and Chandomañjarī. It distributes its materials in 9 chapters or Prabhās. In the first Prabhā Samjñānivandhanam, it admits the regulation regarding the optional lengthening of the short before pra and hra and at the same time adds definition of Gāṭhā. Like Vṛṭṭaraṭnākara, it also has an additional feature

of Gāthā which comprises those metres that are not dealt with in the work concerned, and it puts it as if quoting from the Vṛttaratnākara ad verbum.

Vṛttaratnāvalī of Cirañjīvaśarmā² in the form of a panegyric addressed to his patron Yaśavanta Singha, dialates on the metrics current in the 18th century. In its restricted scope this work embraces some of the Pkt metres such as Saveyā; Kavittha and Durlalitaka, in which the lyrical ballads of Tulsīdāsa and other works in Hindi have been composed.

This fondness of vernacular metres not only allures him to compose his own Skt composition Kāvyavilāsa in some of the metres just mentioned⁸, but makes him to appropriate the poetical licence, regular in the Pkt tradition.⁴ Besides, perhaps this author is a solitary figure to refer to his absorption of the "verse libre" designated by him as "Kavityakāma" in the Skt manual.

Vṛttaratnāvalī⁵ of Venkatesa is written in 66 verses to show the use of the current Varŋavṛttas. Vṛttavārtikam is an attempt of Rāmapānivāda to dispose of the only varṇa metres as to be found in the 19th century.

Among the Varnavrttas only a few are selected as they are not commonly used. Vrhatī and Asthi class of metre are not taken into consideration because they are not selected by the poets. Aryā has been defined without

its Gana system. In its limited sphere, the author reserves thirteen kārikās for the treatment of the five Prastāra vidhi excluding the Adhvayogah.

Chandāmītalatā² of Amītānanda consists of 41 Folia comprising 400 slokas. The author was known to scholars more as a redactor of Aśvaghoṣa's Buddhacarita than as a prosodist. But this unpublished work is conveniently grouped here because of its being directly modelled after Chandomañjarī.

Amītānanda recognises the authority of Pingala at every step paying homage to the Ācārya but appropriates his material from Gangādāsa without acknowledging him. He copied the definitions from the above mentioned text ad verbum. This is sometimes so extensive that he can be charged with slavish imitation or plagiarism. This copying is not sporadic but systematic and is found practically throughout the work.

Some of the verses are bodily reproduced and some are tactfully placed by the insertion of the worshipping diety of the author.³

The verbal borrowings are so numerous that it makes this work an interesting study. In its very form and manner it seems to be a replica of the Chandomañjarl. It is classical and orthodox in spirit and no consideration has been paid to the Vedic and Pkt metre. In spite of this its treatment is improving upon some of the deficiencies of the Chandomañjarl. It does not admit the Pkt metres yet it defines the Aryā in the manner typical of the Pkt tradition.

Along with other long metres Chanda'mṛtalatā insists on the yati in Vasantatilakam and others which are not prescribed by the host of the writers. Among the known writers who support this are the anonymous authors of Śrutabodha and the compilers of Kṛṣṇakavi, both belong to this group. But only difference in them is that Śrutabodha¹ and Chandā'mṛtalatā.² prefer the yati division at 8-6 where as the last one³ fixes upon 7-7. Unlike Chandomañjarī it excludes from its scope the Vaitālīya group but makes provision for the "Śeṣa" metre.

We would close our survey of the works of the orthodox group by mentioning two works Mandāramarandacampū by Kṛṣṇakavi⁴ and Śrutabodha ascribed to Kālidāsa⁵ which are mainly Kavišikṣā type meant for aspiring poet in the devices of the craft. In the section designated as Vṛttavindu, only the definitions of the syllabic metres are appropriated without maintaining their seriality. Only peculiarity that is discernible in this work is to maintain yati in almost all the metres. The most notable are the cases of the Upendravajrā and Indravajrā where yati is prescribed after the 5th which has been detected by our modern scholar. In Śeṣavindu or the chapter dealt with the remaining topics, it enumerates briefly the rules and the regulations regarding the metrical principles and in its manner the impression of Vṛttaratnā-kara is discernible. It speaks also of Gāthā.

Srutabodha on the other hand, is a short compendium of Skt manual where only the general principles are dealt with. in an easy but compatible manner.

In this brief exposition, it makes an attempt to lay the devise by which the common parts of the metres can be detected easily, which is the vital part of the metres.

In Chandomañjarī¹ too we find this method applied. Ina very easy and elegant language he has given us an inkling into this manner. We are not sure who, among expositorsof the Sastra first casts light upon this device. Sufficient for our purpose to note that it is in the commentary of Yādavaprakāśa2, this principle came into light. Among the later writers, Kşemendra in his Survettatilakam has dealt with it at length.

Among the Kaviśikṣā poets, Amarchandra4 and Devesvara5 furnished an elaborate hint on the construction of different metres. Most common and adoptable method is the application of "pitch forking process"—which has been hinted at not only by the metricists but by the poeticists of the late century. The obvious cases of the shifting of the long syllable at the end by addition of a short one in the penultimate portion of the Upendravajra group and Vanisastha pair are well known to merit special mention.6-

Even the commentators of the standard works have not failed to trace these tendencies of metricists. Mānikyacandrain his commentary on Kāvyaprakāśa adduces instances how from Siddhichandha Pramitākṣarā can be created by dropping two syllables from the fore part of the pāda and seven syllable from the hind and Drutavilambita by deducting two from the last part and the seven from the first. Likewise, Śrutavodha² lays down that Campakamālā would be converted to Maṇimadhyam if the last syllable of it is dropped. Haṃsī³ would get its form Mandākrāntā, if the last part of the latter which is demarcated by yati, has been dropped.

The works both published and unpublished just discussed, are indeed noteworthy for their elaborate treatment of Skt and non-Skt metrics. They have merits of their own, but they are, in reality, nothing more than elementary text books, excellent resumes of which methodically sanction the speculations of the predecessors embodying different traditions.

The standard works among these are followed by a host of commentators, who dialate on the explanation of the passages, which practically add nothing new but paraphrase the already existing matters by lucid expositions embedded in file language.

This age witnessed also a host of easy manuals. These works used to repeat only conventional topics in the same:

issues already existed in the preceding works. The work to be introduced presently depends upon no system but appears to have been written for enlightenment of the theory of metrics.

Jagannātha's Chandopīyusa is such a work still unpublished. This work in form is indeed one of the most exhaustive and noteworthy presentations of the later time. It displays a very subtle and independent treatment or at least an attempt at a rethinking of the old problems. The authorshows himself conversant with the old theories which he represents in his work and which he endeavours to harmonise with new currents of thought.

The work distributes its subject matter in four chapters. It is in the form of sutras with a vitti thereon of the author's own.

The first chapter is an introductory one. Here the author enumerates in eighty sūtras different sorts of mnemonics and techniques to be applied in the work. He seems to introduce a novel device, here where in addition to eight syllabic mnemonics² some other terms also have been enumerated which are author's own creation, viz. "gha" represents two shorts, "kṣaḥ" two longs; kaḥ and khaḥ make provisions for doublets consisting of short long and long short respectively. Duplication of any terminology has been represented by the vowel u⁴ and the termination of the middle position has been marked out by consonant "n". For

^{5.} nantomadhyavrt. Fol. 6a. madhye vartate iti madhyavrt.

the pause or ceasure, two different terms such as "tha" has been prescribed for syllabic metres and "bha" for the mäträ metres.

Four matra Ganas, ta, ca, da and na have been prescribed one each for the Ganas of six matras, five matras, four mātrās, and two mātrās respectively. In addition to it, Gaņa of four matras for Arya and its variety has been designated as "ha".2

In defining the syllabic metres, the author follows a method entirely different from the traditional mode of expression. In order to restore its brevity it adopts the shortest possible means. This method is totally different from the traditional one. The author very intelligently points out the common parts of the different metres in terms of their mnemonic constituents and defines a number of metres in such a way that the interrelation of those metres concerned becomes obvious at once with the very acquaintance with definitions themselves.3 The importance of this has been already comprehended by Amaracandra who aptly termed it as marmajña.4

For example, the definition of "jaloddhatagati" metre "jasajasa" which can form the first part of the "prthvi" metre whose definition runs thus "yake prthyi.....". This definition impiles the sense jasajasayaka will be the form of prithvi.

The definition of Chandah covers in its scope both vitta and Jāti by its logical and adoptable appropriateness.5

In the treatment of the last syllable in a feet as being optionally long our author extends full support that is why

he cannot justify the argument laid down by Halāyudha who raged against it.1

In a manner quite opposite to the ancient authorities, Jagannātha's definition of the "quarter of a verse" has excluded the Upajāti and padacatururdhvādi class in consideration of their special features.² He can not cope with the sanction of Nārāyaṇabhaṭṭa whose section for the Upajāti was restricted only to the class of two or more akin vṛttas.³ In a manner quite different from his orthodox predecessors, the author wants to include Daṇḍaka among Mātrāvṛtta. Jayakīrti seems to hint at this point and he includes it in the chapter VI along with the Mātrāvṛttas.⁴

In the 2nd chapter Şatpratyayas have treated in extenso" Third chapter begins with the Upajāti and Padacatururdha class being followed by Daṇḍaka and Mātrā metres. Mātrā chanda is introduced with "Marutcchandaḥ" consisting of six gaṇas of four mātrās followed by "Kīrtiḥ" of seven four matric. ganasgīti, seven and a half-upagītiḥ having one laghu in place of one gaṇa—when this laghu is in the first half this is udgītiḥ and when placed in the last half this is Āryā. This is followed by the discussion on the Vaitālīya-prācyavītti Mātrāsamaka group. Each discussion is appended with a "Samgrahaslokas" which is the sectional synopsis on the topics just treated. Besides, we came in contact with a number of Pkt metres (Fol. 30b) such as Sukhapītā, Harigīti,

^{5.} Fol. 22b. Şaddā Marut......Saptasamudrakīrtih.....Ardhegītih laupagītih pūrva udģītih—parā Āryā.

Dvipatham, Saurāsthra1, Unnāla and Mahotsava, Fourth chaprer proceeds to discuss Vittachandas2. It then takes up the Ardhasama and Visamavittas which closes with the "gadya". Inclusion of the last mentioned topic is justified because it has been appertained by Pingala as gatha, by an extended use of the term.

It does not pay a lurking regard for the old writers and does not bring back blindly or any of the old ideas for appropriation to his manual. Chandopiyūşa displays a reactionary tendency in its language, its subtle reasoning and its unsparing criticism of the earlier writers. To substantiate this, we can adduce only few cases out of the many.

"Hrasvam Laghu"—it has been sanctioned by the great grammarian Pāṇiṇi. He accepts it and at the same time he cannot deny the time honoured usage in the compositionthat is why he laid down Prahradeh Prakkvacit.4

Jagannātha did not hesitate in picking up the irregular use of the great poet grammarian Bhattis who used "nagana" or three laghus in the first four syllable violating the rule "Naprathamātsnau".

Even the irregular use of Dohā cannot escape⁶ from his keen observation.

The author of Chandoplyuşa displays a subtle and independent treatment or at least an attempt at a recapitulation of the old problems. He is conversant with the prosodical

theories of the predecessors, which he does not set aside; but endeavours to harmonize them with new currents of thoughts. In his general treatment he makes an attempt to cover almost all the trends of thoughts traversed by his predecessors.

In short it can be said that Chandoplyusa deserves to be mentioned with high esteem because of its novelty of treatment, albeit the obscurities due to its brevity of exposition necessitating lucid commentaries instead of a simple vitti.

To most of the writers who followed the foot steps of Pkt Pingalam. Vṛttaratnākara and Gangādāsa, there was hardly any original work. The details of the new system having already been gradually accepted there was apparently no occasion for any creative work. There are very few in number like the author of Chandopiyūṣa and the versatile scholar Bhāskara Rāyā¹, who possess the genius of making an entirely new departure.

Gangādhara's Chandonusāsanam is the only work among the three (1) Chandonusāsanam, (2) Chandosārah and (3) Chandaḥpāṭha² available till now, working but the already accumulated stock of ideas in the light of a new scheme. Novelty of its treatment lies not in critical elaboration, but in novel arrangement of the metres. Technical terms and figurative symbols in the code of nomenclature regulating the cardinal principle of the science are indicative to line traversed by the Pkt tradition. Varņavṛttas have to lose its own identity because of their existence to the mātrā basis.

This work comes from the pen of a versatile scholar of the 19th century whose manysided scholarship enriched the Skt literature in all ways. The codex consisting of 42 folia, distributes its subject matters in six chapters. In the first

Two voluminous works:—
 Bhāṣyarāja—MS. ASB. III A77; Vṛttacandrodaya III C 94.

^{2. 1.} Skt college. chandah 34. 2. Skt. coll. chandah 37. 3. An incomplete work, containing 2 Folia, but appeared to be or commentary on Pingala ch. Sütra.

chapter it, instead of treating the Varnaganas and Mātrāganas differently, places them under the same category. Thus"Ma" having three gurus is to be read among the group of the six mātrās rather than among Varnaganas, though he mentions the Mātrāganas adopted by his perdecessor. After making a fair treatment of Devatā, Mitra and Amitra of the Ganas in the chapters II and III respectively, it enumerates the metres in general. In the treatment of the syllabic metres Gangādhara adopted a new principle in which the syllabic metres are arranged in accordance with the number of syllabic instants in a pada. Fol. 31a. "Atha miśrakamādhyāyah vyākhyamo varnamātrayah yatra vaiṣamyamuddiṣham pādeṣu varna mātrayoh".

In the following chapter the subjects have been arranged in the mixed principles such as "varuasāmye kalāvaiṣamya" equal in syllables but not in mātrās—in which category fall the Anuṣṭubh and the Upajāti. "Mātrayā varuena Ardhasamam"—that comprises the metre Vegavatī, Puspitāgrā; Pādanirdešena kalayārdhasamam varuato viṣamapadaprakaraṇam"—equal number of mātrās in each alternative half but not equal number of syllables—this includes, Vaitālīya; Aupacchandašika etc. "Padanirdešena kalāvaruavaiṣamyam"-in this group besides some known Pkt metres there are "Viggātha" Simhinī etc. The last one is "Kalāsāmye varuavaiṣamyam" which contain equal number of mātrās but not equal number of syllables to which group can be included the metre "Hākali" as a solitary instance."

^{3.} Fol. 39. Prathamau Tu caturdaśau kalāvekādasauksaraghatitau śesau daśo ksaraghatitau hākalirūpah kayi gaditam.

The concluding chapter designated as "Samamātriyama-dhyāya" dwells on purely Pkt metres beginning from 11 mātrās in each pada to 32 mātrās. This comprises nearly all metres beginning from eleven matric Dīpaka, twelve matric Madhubhārah etc. including even Dandakalā¹ which consists of two or three hundred kalās.

This work in brief extends an outline of a new system which attempts to take into consideration all the metres in view and to build a synthetic theory of metres that hitherto does not exist, blotting out the distinction lies between varuachanda and mātrāchanda.

With works discussed before, we can temporarily close our survey. Practically speaking, the details regarding all kinds of metrical systems having already been well established, there are apparently no room for any creative work. The commentators who crowded this period busied themselves in interpreting the already established rules, in adding here and there some minor points of details not clearly made out by the predecessors. This period, obviously like the preceding ones, witnesses numberless commentaries written on standard works like Vrttaratnākara, Pkt Pingalam, Chandomañjarī and even on Strutobodha. Most of them however remained in manuscripts swelling up the collection of the different mss. centres.

For these with whom we come in direct contact either in printed or in manuscript form we would propose to prepare some digestive notes concentrating only on vital points on which they make deliberations. Besides, we would not lay aside the minor commentaries also written on the standard texts. of course, we would cast only some cursory glances on them without going into details for they do not call for any such treatment.

^{1.} Fol. 40b. Laghugururniyamābhāvāt dvitrišastakalāvargo daņdakalāh Tadyādi sarvavaraņalaghu bhavati Pingalanā gabhanatyeva.

In the major commentaries, two distinctive characteristics are discernible. One, a made easy type of works belonging to a group of faithful commentators who are more anxious to interpret than to incorporate new ideas in the system they commented upon. The second type is a kind of critical elaboration, which dwelt upon each and every side of the works minutely. But they sometimes suffer from an inordinate bias for the orthodox traditions and from occasional obstinate haphazard generalizations as well. In their treatment we find the scholastic delight in indulging in fastidious refinements. But at the same time there is a sincere effort to unify the various currents of thoughts and principles established in different traditions by synthesising them with the central principle of Vedānga chanda.

Most outstanding of the first type are the commentaries of Nārāyaṇabhaṭṭa, of Rāmacandrakavibhāratī and others whowrote on Vṛttaratnākara and of the second type there are Abhinavavṛttaratnākara on Vṛttaratnākara and Bhāṣya Rāja on Pingala Chandasūtra. Both of them are from the versatile scholar Bhāskara Rāya.

Some of the commentators have been credited to play double role as commentator and as a full-fledged author. This sometimes resulted in presenting two separate works or a unified one. Abhinavavittaratnākara ascribed to Bhāskara Rāya may be a commentary on Vittaratnākara or a critical elaboration on metrics in general.

Among the commentators of Vittaratnākara, chronologically the first place may be assigned to Rāmacandrakavibhāratī. He is known to be the author of another work on metrics named Vittamālā which incidentally gives an account by the celebrated monk Mahānetraprasāda.²

Most of the excerpts are from Pingala, Jayadeva, Chandomañjarīkāra and Śrutabodhakāra.

^{1.} Vrttaratnākara Pancikā-ed. Nirnayasāgara press-1948.

^{2.} Printeddin Colombo by Mark Cakanavakagi Bharati Ressigntri

Rāmacandra is a simple and sedate writer, so simple that he is bent on offering the reader a mere literary paraphrase on some vital issues which deserves scrutiny in treatment. But his lucid, practical exposition helps in many ways to make the subject of six pratyayas easily comprehensible.

Among the commentators the most familiar is Nārāyaṇabhaṭṭa and his commentary "Maṇimayī" is widely circulated in printed form.²

But this commentary is not an ideal one. Like the preceding ones, it suffers from inordinate bias for the orthodox tradition. In the observation of crucial points, specially on the issue of accepting the reading "pādādau" because³. Srutabodha has shown the pāda arrangement.

The intention of Kedāra is to restore the reading "Pādādau" because, in this Āryā verse the short is intended at the end of the 3rd pāda, longs at the end of the 2nd and 4th pāda respectively. But the case of the lengthening is due to contact of the conjunct consonant existed at the beginning of the 4th pāda to which it maintains a "krama", i.e. a seriality.4

But sometimes in practice too the lengthening of the short is obtained before "hra" and "pra" but the occurrence of this is due to other reason.

Lastly he summarises his opinion in a self-composed āryā-

^{1.} Comm. on I. 11. Padyasya caturthomsah pādah, tasyādih pādādih. Iha sāstre pādādau varņasya aksarajāteh Samyogah kramasamjñitobhavatItyadhyāhāryam.....

stanza.1

In order to restore the reading "pādādau" he has to say much. But in the long run his exposition on this particular issue proves that our commentator fails to understand the underlying intention of Kedārabhaṭṭa. Similarly, in connection with his exposition of the generic role of Upajāti, Nārā-yaṇabhaṭṭa seems to be bent on an interpretation which proved to be derogatory to the doctrine of Kedāra.

Kedāra extends the scope of Upajāti even to the metres belonging to Vijātīya class, but Nārāyaṇa in his gloss does not support this. In his opinion, extension should be restricted only to "Sajātya" class of metres. Therefore, the hybrid type of metres composed of uneven number of syllables, the metres having pause at uneven places and any type of mātrā metres can not be termed as Upajāti. 2

Nārāyaņabha;ţa's argument is justified and conclusive in so far as the inclusion of the Vaktra class among the Mātrāvṛttas in Vṛttaratnākara is concerned. He elucidates the fact that there lie some affinities between Mātrā metres and Vaktra metres.

In both these classes there is no fixed combination of guru and laghu, although the Vaktra class has been assorted among the eight syllabic metres and in both of them there are some common designations namely, pathyā, vipulā and capalā. 8

^{3.} Comm. on. II.21. Atha vaktrasyāstāksaratvenānustubhi vaktavyasyāpi cc-0 Jangamwadi Math Collection Digiti ad avatrasyaniyataguru aghur vabhavat pathiya otri capalādi

With due acknowledgement, though Nārāyanabhaṭṭa has profusely used the exposition of Vṛttikāra. he sometimes referred to Yādavaprakāśa without referring to its source. 1

In connection with the inclusion of the metres consisting of syllables less than six in number, this commentary has pointed out that they have been approved in Pingala's text as in the Sastrakara's text according to the maxim jnapaka which is evident from his last chapter on pratyaya.²

In the section on Gāthā, he has incorporated a number of excerpts along with the definitions of the Pkt and the Apabhramsa metres.

In short, Nārāyanabhaṭṭa's commentary which is more expository than critical has kept this exposition apart from the vexed question of acceptance and non-acceptance.

Cintāmaņi Daivajña is known to the metricist more for his work Prastāra Cintāmaņi than for Sudhā³, his commentary on Vṛṭṭaratnākara. Both these works are still unpublished. The date of the commentary can be ascertained from the precolophon verse in which it has been stated—Nandavāna-sara bhūmitasaka—i.e. 1559 saka—1637 A.D.

No peculiarity can be noticed in this commentary; it is a plain and literal exposition made for easy comprehension.

Cintāmaņi like Trivikrama and Halāyudha, has been illusioned about the Pkt tradition where the Āryā has been accepted as Mātrā metre distributed among the four pādas.

That is why he unhesitatingly accepts the reading pādādau.

Incidentally, something may be said about the Prastāra-Cintāmani which though still unpublished is widely circulated among the scholarly world.²

This text consisting of three chapters with an exposition on it in prose, deliberates on the science of prosody mathematically developed in the circulation of all its possible combinations. This work provides a special chapter designated as Khandaprastāra elucidating the subject of rhythm.

Another popular commentary on the Vṛttaratnākara which has found its entry nearly in all the catalouges of the mss is the Setu by Haribhāskara still in mss form. 3

Setukāra subscribes himself to the view of his predecessor who adopted the reading "pādādi" because, the verse in illustration is in Āryā metre and in the metre Āryā pāda arrangement is not intended.⁴

Sulhana has been severely criticized by Setukāra, for his misinter pretation of the Sūtra "vitānam anyad" restricted to the applied in specific case like Nārācakam.⁵

Nārāyana has been severely criticized by Setukāra on the issue of the Upajāti, in the scope of which the former tried to restrict the metres with equal number of syllables. It must be broad enough to embrace all kinds of hybrid type

of metres whether consisting of the same genus or not.1

Sulhana had shown in his commentary that Mañjarī and Kalikā are synonymous. But Setukāra points out that according to Amara "Vallari Mañjari" are synonymous and feminine whereas. Kalikākorakarnak are masculine. Therefore Sulhana is wrong in doing so.2

Setukāra's interpretation of the verse "Samastam vānmavam vyaptam trailokvamiva visnuna" is not truely in keeping with the orthodox spirit.3

In order to sanction these metres that are not dealt with in the manuals; but are found to be used in the literature, Bhāskara Rāya tries to show that the scope of Kedāra's definition of Gatha being on the line of Vedanga chandakara, is credited to be extended to all kinds of metres found in use but not in the given manual.4

We should here endeavour to make passing reference to a number of unpublished made easy type commen taries.

Vīttaratnākaradar a or the mirror of Vīttaratnākara is one of the orthodox type which follows the foot steps of Halāvudha.

ASB. G. 5841. Incomplete. I. O. Codex is coined with the date 1740 - 1684 A. D.

Vīttaratnākara Bhāvārtha Dīpikā¹ is an ideal commentary, to whom the real intention of Kedāra has been clearly discerned. He parts with his predecessors while he accepts the reading "pādādau" because Pingala has promulgated "Svarārdhamāryārdham".

Any kind of mātrāsamaka group being arranged in four Gaņas of four matric group would be termed as pādākulakam being padded with rime.

Bhadravirāt is nothing but Aupacchandasika but in the latter there is the provision for the arrangement of the group of six mātrās where the latter lacks it. To enrich our available store of knowledge we can say that this commentator has also been credited to have composed an independent work Vīttapradīpa. We are here to dilate only those portions on which our commentators spared pains to bring the intended meaning to light.

We would close our discussion by placing here a short commentary consisting of 14 Folia, entitled Sugama vrtti⁵, by one Jain Samayasundara. Because of its lucidity of style and simple expression the commentator has been designated so. The Vrtti has been dated as 1694 samyat.⁶

ASB, G. 5858 with no date mark. BORI MS has been coined with the date 1711 saka. 489-1899 BORI.

3, Ibid.

The next commentator of our concern is Bhāskara Rāyā, whose importance lies in his learned expositions of the Skt metrics, in his well known commentaries on the text of Pingala chandaḥ sūtra¹ and on the Vṛttaratnākara.² His erudition, reputation as a versatile scholar and profound scholarship no doubt added weight to his masterly creations and contributed a great deal to the preparation of the survey of the general trend of the Skt metrics.

He is a polymath writer and is credited to be the author of more than fifty works four of which are on metrics. ³ Of these again two are known to be commentaries on Vittaratnäkara only, and one is on Vedängachanda.

Among them two are recorded to be the commentaries on Vittaratnākara. Truely speaking, Vittacandrodaya or Abhinava Vittaratnākara, a voluminous work is to be called as a critical elaboration on the metrics rather than a commentary.

Mṛtasañjīvanī is perhaps Bhāskara's early venture to write a commentary on the standard work like Vṛttaratnā-

^{1.} ASB. III. A. 76.

^{2.} ASB. III. C. 94.

^{3.} Vṛttacandrodaya, Bhāṣyarāja, the chandakaustubha, and the Mṛtasañjīvanī. First two are preserved in Asiatic Society of Bengal and last one belongs to the collection of Adyarlibrary (VI.No. 774) MS. No. 10. B. 7.

S.P. Bhattacharyya noted that kaustubha is different from his own work Chandaḥ kaustubha. Vādakutūhala, another work on metrics contains one section dealt with metrics.

kara, when he has not owned sufficient aptitude on the Chandah Sastra

The work is completed in 72 folia and Abhinava Vittaratnākara is the production of his mature pen. It has been composed in 30 years after the composition of the Mrtasañ. jīvanī. It may aptly be called a critical elaboration of whole Chandah Śāstra rather than a commentary. The introductory chapter which comprises 103 Folia, deals with metrics in general.

While Bhāṣyarāya concentrates on a definite work dealt with by Kedara, he brings into review the whole of the works on metrics that he traversed. His acquaintance with this sastra enables him to make a hair splitting judgement on many crucial issues.

Bhāskara Rāya is to be called last important writer and annotator. Albeit he was othodox in spirit, like a practical politician he had to concede to a good number of lapses and violations.1 For his inordinate bias for the Vedic affiliation of the Skt metrics, he would seek even the origin of Mäträvrtta in the Veda.2

He was intelligent and vastly read scholar. He exploited his acquaintance with old literature including the Vedas. What he did in these two commentaries on the accredited Classics is that he dealt with in old Sastric manner. But in-

no case, he could brush aside the practical side of application, the authority of usage.

Bhāskara has regards for respectable antiquity, specifically for his predecessor Yādavaprakāśa whom he always referred to as "prāncyaḥ". On the other side, he was profusely used Halāyudha's Vṛtti and naver hesitates to jot down the flaws and to lay down the necessary remedies.

He is to be aptly called an "elaborator and finished debator" and he proved himself to be antagonist to the most of the writers including even minor ones who do not deserve such a scrutiny in treatment. An intellectual gaint as he was, he did not feel any sense void of dignity to seek support from Chandomañjarīkāra for the case of Vaktra class in order to justify Garudapurāņam who insert Vaktra in Prakīrņādhyāya.

He has amassed a vast amount of materials from all branches in order to note the lapses from the standpoint of the dicta of the metrics.

Vrttacandrodaya written in metrical exposition indicates extensive learning and constitutes a compact manual of metrics in sixteen chapters or Tarangas. 4 It has begun

Fol. 31b. Ibid - Prāñcistvatraiva plutamelaneva navadhā vibhāgamāha. Bhāşya Rāja F. 45a-45b-Caramasūtradvayam na kartavyam iti vṛttikṛtām pramādaḥ.

^{4.} The sixteen chapters of Bhāskara Raya's Vrttacandrodaya deal exclusively with the poetic figures in the following order and divisions.

⁽i) dealt with upto Pol.104a Laukika chandah (ii) metres upto Fol. 141a in general (iii) Mātrāchandas (iv) Mātrāchandas having their alternative pā las similar. (v) Mātrāchandas having their alternative pā das dissimilar.

with an intention of exposing the manual of Kedārabhatta. But the author could not abstain himself from displaying his scholarship in erudite work of which are preserved the last two chapters for the Vedic metres.

Bhāskara's manner has in many ways been proved to be ingenious quite unlike other medieval authors. We would enumerate some in the subsequent.

While dilating on the special features of three big genera Samānī, Pramāņī and Vitānam, to which all the metres can be included, Bhāṣyarāja very earefully upholds the picture of the subject arrangement of Pingala in his Chandaḥ sūtra. All the sections, containing Vaidika. Mātrika and Vāṇika metres are introduced first without pāda then the jurisdiction of the pāda begins. Thus one can see that Daivī, Gāyatrī etc. are without pāda and after the introduction of the sū tra pāda the metres of Gāyatrī class came into being. Similarly, Āryā metre has no pāda system. In the case of the syllabic metre we can see, three big genera Samānī, Pramāṇī and Vitānam have no pāda restriction and the jurisdiction of pāda commences with the Anuṣṭubh metre pādasyanuṣṭubh vaktram.¹

In a manner quite unprecedented in his line Bhāskara

in Mātrā metres : (vii) Gadya or metre without feet (viii) Chapters dealing with pratyayas relating to metres based on mātrās (ix) Syllabic metres (x) Syllabic metres with their alternative feet similar (xi) the same with their feet dissimilar (xii) Irregular or gāthā in syllabic metres (xiii) derivative metres (xiv) Pratyayas relating to metres based on syllables (xv) and (xvi) deals with vedic metres.

CC-0. Jangamwadi Math Collection. Digitized by eGangotri

would refer to Dandaka to be found in the Vedic Texts.1

In a very restricted way we have talked about these expositions still awaited to be published. Bhāskara is the last great exponent of the orthodox school and the great annotator of the century. His name cannot be associated with the establishment of any particular system as has been done in the case of Pingala or Vrttaratnākara although he shows great fertility and acuteness in his treatment of metrics which have been implicitly followed by later writers like Jagannātha and others.

Here is given to Indian scholars a rich material for subtle distinction and endless elaborations with hair splitting care, befitting scholastic minds.

No works in the Skt metrics other than these voluminous commentaries have brought into light the tentative efforts of the earlier thinkers. By their thoroughness and masterly exposition these would eclipse all the fame of the predecessors and would dominate, as it is expected, the thoughts of the generation of the theorists.

The existing commentaries on Pkt Paingalam are mostly late and gloss-type words and are therefore hardly acceptable to a critical student of history. Of the commentators who wrote on Pkt Paingalam, of course in Sanskrit, only a few have been selected here with due regard to their historical importance.

Ravikaramiśra deserved to be mentioned as the earliest commentator. His work is not an ideal one. This is not a running commentary, neither is it an exposition but in the true sense of the term, it can be called either a perpetual gloss or an explanatory note.² It is accompanied by a full

index at the end of each part.

The commentary of one Kṛṣṇa whose exposition has been designated as Kṛṣṇīya vivaraņam also keeps reserve for such treatment.1

Lakşmīnāthabhatta2, the father of the celebrated author of Vrttamauktikam, wrote a voluminous commentary on Pkt Paingalam. It follows the footsteps of Chandomanjarī, and utilizes the work Vānībhūṣanam.

Laksmīnātha omits attaching an index in his commentary. But he makes provision for an index at the close of the last chapter of Vrttamauktikam completed by hims the death of Candrasekhara who completed only 1st chapter without any index.4 Incidentally can be named the Pingalaprakāsatīkā of Vamsīdhara who wrote his exposition in Sanskrit.

We have non-practically closed our survey of the principal writers of the post medieval period, who deserves mention and treatment. The commentators and the text book writers continued to multiply the serial number of the catalogue of the mss of different centres. Only a glance at their names and works given in the preceding deliberation will show the extent to which their activity was carried, where the demarcation between Skt and Pkt is nearly in a position to be blotted out.

II. CHRONOLOGY OF THE AUTHORS

Widest possible divergence of opinions exist as to the actual date of Pingala. Indian tradition glorifies him as the reputed author of the Vedanga chanda sutra. He has been assigned to the mythic age and his very personality has been identified with the fabulous being represented by the mythologists in the shape of the legendary serpent, Sesa Naga.

While the sole known basis for assigning a terminus aquo lost in the numerous mythological stories, the terminus ad quem is almost certainly the age when Savarswamin wrote Mīmāmsā sūtra. Due to the wide conflicting views. the date of composition of this manual has been oscillating between the 5th cent BC, and the 4th cent AD.

That he was the oldest amongst the extant writers on metrics is generally admitted. A comparison of the different printed editions as well as the works with different commentaries would go to show that they do not agree about the number of the sutras in the texts.2

Earliest limit has been afforded by M. M. Ghosh¹ and Weber² who believed that the Vedic portion demands to be placed in a remoter period of antiquity than the portion dealing with the classical one and can be dated back to 500 B. C. i. e., in an age simultaneously at the close of the sūtra period and at the commencement of the Astronomical and Algebrical speculations. The lower limit has been fixed up by Dr. D. C. Sarkar to the 4th cent AD³ who is of the opinion that the work in its present form cannot be much earlier than the Gupta period because of the reference of the use of Rtu as "Sańketa Sańkhyā" expressing the number six. This particular term in sense of the six has not been stereotyped before the Gupta era and this very expression is absent in the Vedic literature.

MM H. P. Sastri⁴ believed in the story of the Aśokāvadāna according to which one Pingala has been appointed as the teacher of Aśoka and his brother. In another dissertaion,⁵ Pingala has been incidentally placed after Pāṇini but before Patanjali.

Jacobi had beliefs in this identification. Pingala's work like Aşṭādhyāyī of Pānini is old and has been looked upon as the prototype from its very inception for its planning and its execution.

Colebrooke⁷ made a bold attempt to identify Pingala with Mahābhāşyakāra Patañjali, because, the former has

been aptly described Pingala nāga or Śeṣanāga. Rāmabhadra in Patañjalicarita described Patañjali as incarnation of Śeṣa and Mahābhāṣya has deen referred to as Phaṇī-bhā-ṣya. 1

Sadguruśisya the celebrated Vedic scholar in his Vedārtha Dīpikā has taken Pingala to be the younger brother of Pānini.² Macdonell placed this Vedāngachandahśāstrakāra in the pre-Christian era⁸ i. e., in the 2nd cent B. C.

Sukumar Ranjan Das⁴ thinks alike and contends that Pingala, the author of Chandaḥ Sūtra lived in 2nd cent BC, in whose work the earliest reference of zero can be found.

Siva Prasād Bhaṭṭācarya laid stress on the double authorship of this work and believed in the existence of Pingala in the early centuries of the post-Christian era as the ornate metres dealt with in the classical portion could not have been found in the Epics. Maxmüller in the history of the Skt literature shows the improbability of the acceptance of the view that Patañjali and Pingala are the same. These opinions require proper scrutiny with a view to finding out some reliable data for the establishment of the date of Pingala. The definite terminus is to be obtained from the references in the Sabarabhāṣya belonging to the 3rd Cent AD. This is a positive evidence that nullifies the arguments of

P. 370. Jadunath Sinha contends that Savara flourished in 300 AD. History of Indian Philosophy Vol.I.P.763. 1956.

Dr. Sarkar simply based on probability. Further, it can be demonstrated that the opinion that the reference of six seasons did not exist in the age of the Veda proved to be baseless. There are innumerable passages in the Atharvaveda where the names of six seasons have been expressedly noted. These passages can be unhesitatingly placed before 500 BC.

It has been sometimes held that the classical metres dealt with in Vedānga Ch. Sūtra are in their most developed forms than those found in the Epics. Therefore the argument that the latter must be placed in the post-Christian era, proves to be unacceptable, if one recalls in this connection the age when Mahābhāṣyakāra has flourished and quoted numerous passages drawn from the works of his predecessors exhibiting classical ornate metres. Besides, Epic literature as a heroic poem should select Anuṣtubhas as the only metre for the description of the heroic achievements which seems to be the only suitable metre as has been asserted by Aristotle, that Iambic and Trochaic have been chosen for the heroic poems for its special quality of movements and force.²

It has been further asserted by Keith³ that the corroboration of the evidence of Patañjali can be obtained from the Chandaḥsūtra of Pingala.

These evidences lead us to the conclusion that the Chandaḥsūtra of Pingala flourished sometime before the Christian era and not in the post-Christian era as held out by some scholars.

The evidence of the existence of the advanced kavya

^{1.} RK. Veda.III.56.2; VII.87.5 there has been the references of the six seasons in indirect manner. Ath. Veda.XV.4.1; 4.2.; 4.3.; 4.4.................VI.552.

^{3.} History of Skt Literature P.48.

literature exhibiting classical ornate metres can be substantiated by the references of the metrical passages occurring in the Mahābhāṣya.

The medieval mythological story pertaining to Pingala seems to retain some ancient facts in its own way. Those classical metres are prior to the age of the author of Mahābhāṣya, i. e. 2nd cent B. C. But that does not prove any definite chronological sequence with reference to Pāṇini. There is a long gap between Pāṇini and the Mahābhāṣya. Pingala may safely be placed before the age of Patañjali. Now, if the Śeṣa nāga is identified with both Pingala and Patañjali, then they may be regarded as contemporary.

Rājašekhara gives some hints at the fact that the author of Chandoviciti is to be placed after Pāņini but before Patañjali² separated by Vyādi.

Our assertion however would not go against the verdict of the Śāstrakāras just mentioned, if we just make passing reference of a evidence for consideration. Among the metrical passages, there exists one-line, "Varatanu Sampravadanti kukkuṭaḥ"—exhibiting a metre appropriated by Jayakīrti, Vṛttaratnākara and others but not by Piṅgala. If Piṅgala comes after Patañjali this verse would not escape the notice of the Śāstrakāra who in that case must have codified it, because, the Chandaḥ śāstra is a prayogaśāstra.

These deliberations will go in favour of the assumption that the text of Pingala existed in its present form at least in the 2nd cent B. C. if not earlier.

Bharata's work is encyclopedic in the scope but its primary theme is the drama, consequently in its application of metres, it concerns always with drama.

As to the relative date of Bharata, whose apocryphali

^{1.} See Infra P. 11.

[.] See Infra F. 7.

work devoted two chapters on Skt metrics and one for Dhruvā metres, scholars are not of unanimous opinion.

The text has been subjected to considerable rehandlings in later times, because Abhinava Gupta1 himself asserts that he was aware of the two recensions2. M. M. Ghosh8 lays down that the NS' is the earliest available treatise on the classical Skt and is older than the section dealing with that of Pingala's Ch. Sutra. Because, in Pingala the treatment of Classical Skt metres is much more elaborate than in NS' and Pingala's terminologies have been left out of consideration. On the evidence of the Skt metrics only, NS' may be roughly placed between 200 AD and 400 AD.4 In case of the Dhruvā songs⁵ also, M. Ghosh laid down tentatively the same date. Mm. H.P. Sastri, restricted the date of NS' to the far away past to 200 BC.6

Dieter Schlingloff in his introduction to Chandoviciti asserts that the chapters dealing with metrics in the NS' are older than the work of Pingala.7 The manner and methods discerned in this work Chandoviciti show that this work is dependable more on NS' than on Pingala. Besides, there are some verses which are drawn from NS'.8 And the work in mss is no later than 4th cent AD on Paleographic ground. Then we can have one limit of the chapters of NS' dealing with metrics, by the date of Chandoviciti, which is not later than 4th cent AD.

^{1.} Abhinava Gupta flourished in 11th .cent. AD (1015.AD) P.112. S.K. De. History of Skt poetics. 1960.

^{9.} Nach Lüders Ansetzgung dieser Handschriften etwa in die zweite Halfte des 4 nach christilichen Jahrhunderts datieren. P 4......Ibid Ibem.

Another limit can be furnished by the date of Pingala. The fact that Pingala is later than Bharata could not be carried out on the following ground:—

(1) Taking the substance of the work, the text history of NS' shows that even in the chapters dealing with Skt metrics, different systems exhibiting two recensions can be found. One recension introduces the terminology of Pingala¹ while the other recension uses the terms laghu and guru in defining the scheme of metres.

Further differences of the style of treatment is due to the fact, that the respective chapters in NS' and Pingala's Ch. Sutra follow two different traditions, in the treatment of metres they belong to two different schools. NS' 's tradition has been followed by the Pkt school of Metrics who appropriates generally those metres that are found in NS' but are absent in Pingala.² Lastly, it can be said that the contention that the respective chapters of NS' are older than Pingala Ch. Sutra is proved to be totally base less. Because in one recension, Bharata used Pingala's mnemonics.³ In the same portion, the term used by Pingala for the mnemonic is found to be used. While going to define the metre Dandaka, NS' inscribes the term

Verses — 83 to 87 of XIV. XV.20—21. 20th Verse is described in terms of guru and laghu and 21th in terms of Trikas.

Paingalam does the same.

Most of the metres are appropriated by Hem, Jayakirti, Pkt P.
etc. Such as Śreńi (NS' XXXII.297) Candanaprakṛti.....

(Hem.II.349). Tvaritagati (NS' XXXII.237) with same designation
(Hem.II.219) so on.

^{3.} Pingala Ch. Sütra 1. 3. CC-0. Jangamwadi Math Collection. Digitized by eGangotri

"Kāguhā" instead of the "ra". Winternitz too thinks that Piùgala-Chandah Sūtra is older than NS'.2

From the date given above we are in a position to infer that the substance of Bharata's work is probably much younger than that of Pingala, but much older than that of the Chandoviciti, the recently discovered work of Turfan collection.

Therefore, taking the substance of the work, apart from the vexing question of different recension, the portions of Nātyaśāstra which deal with Skt metrics and the Dhruvā metres, have been conjectured to have been compiled between 2nd cent. BC and 3rd cent. AD. This is sought to be supported by M. M. Ghosh who placed the chapter dealing with Dhruvāsongs in 200 BC3, on the examination of its language.

As a matter of Chronology next to NS' can be placed the text of the Chandoviciti which has been recovered from its fragmentary condition and belongs to the Turfan collection of Late Prof. Lüders.

This work has been edited by Dieter Schlingloff.4 Of the 32 folia preserved there is hardly one which is completely obtainable. The script of the ms will give us one Terminus of date of its composition. With regard to the other Terminus, we have to go through the contents of the text from the available Folia. In the manner of the execution of the plan and procedure, Chandoviciti follows footsteps of Bharata more than that of Pingala. A few of the illustrative verses found in Chandoviciti have been

^{1.} Dandakam namavijueyamutkrteradhikakşaram. Meghamalādikam tatsyannau cadau ka guhātrikā II.XV.143.

^{2.} Winternitz. Vol. III.P.29. Jünger als Pingala's Chando sütradas XV Kapital des Bharatiya Nātyaśāstra, das liber Metrik handelt and zahlreiche Beispiel fur die einzeleen versmae gilt.

^{4.} Herausgegeben in Auftrage der Akademic von Brust Waldschmidt. 1958.

utilized by Jānāśrayī¹ and Halāyudha. We have shown already, there are some common verses in NS' and in this work.

So on the examination of the contents of the text and of NS' we can presume that the work Chandoviciti, has been composed in a time between 2nd cent. AD and 4th cent. AD.

Purānic tradition through the ages has exerted its influence on the scientific principles of the varied type of Skt literature. School of opinion represented in metrics by the respective chapters dealt with prosody of Agnipurāna, Vishaudharmottarapurāna. Garudapurāna and Nāradiyapurāna in many respects exhibits orthodox system. Date of the two aprocryphal work Vishaudharmottara and Agnipurāna like other Mahāpurānas are uncertain.

Vishnudharmottara is counted as an Upapurāna. But both these are puranic works of encyclopedic character. They in course of their rapid treatment of multivarious subjects devote a few chapters to the topic of metrics. Vishnudharmottara has only a few verses to dwell on metrics.2 And the brief contents that it possesses exhibits that this portion of this Upapurana belongs to Orthodox period of history of metrics. 8 Agnipurana devotes eight chapters (328-335) on metrics in a fashion after Pingala and designates them as "chandaḥsāraḥ." Agnipurāņa has been cited by none of the known authors on metrics except some late versatile scholars like Bhāskara Rāya and Gangādhara Kavirāja. Pañcasāyaka the work on erotics of Jyotirīśvara sanctions the authority of the Agnipurana as the author of metrics. JyotirIsvara seems to flourish in 14th cent. Halayudha in the 10th century picks out some portions without

 Kṣīyamanagradasana — P.45; on V.32; with some deviation.

^{2. 111.}Ch. 308(1-20 verses).

^{3.} Bangabast ed JaVangabeda/1616 ollection. Digitized by eGangotri

referring to Agnipurāņa while commenting on the Sūtra 1.10 and he lays down—"Vāpādanteguru iti gurutvam satyamuktam". In another place, Halāyudha perhaps remembers Agnipurāņa while he refers of the sixth pratyaya.?

This evidence would perhaps fix one limit of the date of these portions of Agnipurāṇa. The second passage of the initial verse such as—Sarvādimadhyāntaglau mnau bhyau jrau stau trikau ganaḥ has probably been copied from Jayadeva. Again, the sixth pratyaya which has not been dealt with by Pingala and Bharata in their respective works, has been appropriated by the Author of Agnipurāṇa perhaps from the work of Jayadeva. Therefore it is not improper to place these portions of Agnipurāṇa after Jayadeva whatever may be the date of purāṇa as a whole, which is a kind of ambitious cyclopedia. We may assume from what has been deliberated in the chapters of Agnipurāṇa dealing with metrics must have been composed in a time between Jayadeva and Halāyudha, i. e. 600 AD and 1000 AD.

Varāhamihira's work on Astronomy Brhatsamhitā provides the chapter 103 for the speculation on Skt metres. The date of this work has been more or less fixed with certain exactitude, in the 6th cent. AD.⁵

Jayadeva's Chandonuśāsanam is the standard work which has been referred to by a host of the metricists of the 10th cent. AD. But Jayadeva referred to none. So we have one terminus for the date of this renowned prosodist.

^{3.} Agnipurāņa 327. 1—2. Jayadeva — 1 — 1.

^{4.} Agnipurāņam — 335—8; Jayadeva 8.12.

Basu, Sacred book of the Hindus. 1912. P.111 427 Saka era.507 AD.
 Iyer, Brhatsamhitä, introduction v. 1884. "505AD is considered by some to be the date of Varāhamihir's birth and AD 587 to be the date of his death.

Jayadeva is referred to by Halāyudha as Švetapataḥ in his commentary Mṛtasañjīvanī, on the Sūtra I. 10. "Vānte guru iti proktam jaistu Švetapatādibhiḥ....."; on 5-8.\frac{1}{2}. Abhinavagupta of the 11th cent\frac{2}{2} in his gloss on NS' quoted Jayadeva.\frac{3}{2}

Svayambhū perhaps before 1000 cent, AD, mentioned him as a prosodist who along with Pingala adopted the yati in Skt metres. Jayakīrti in 1000 cent. AD too remembered him along with Pingala and others. Bhattotpāla in his commentary on the Chandoviciti portion of Brhatsamhitā consulted Jayadeva's work without referring to the name, and quoted the definitions from Jayadeva's work. Dr. Kane has convincingly proved that the date of the Bhattotpala cannot be later than 850 AD.

The only commentator on Jayadeva's work is Harşata' the son of Bhattamukula. This Mukula, according to Velānkar⁸, may be identified with Mukulabhatta, the author of Abhidhavrttimātīkā assigned to 925 AD.

Jayadeva is later than Mitradhara the author of Chando-viciti because, in the available MS. folia, Jayadeva has not been quoted. But he is earlier than Bhattotpāla of the 9th cent. AD. So it is not unlikely that Jayadeva flourished sometime between 5th cent. AD and 9th cent. AD.

Jayadeva I.4.; 5.5. Anyadato hi Vitānam. Halāyudha — Anyadato hi Vitānam Švetapatena yaduktam.

Janāśrayī's Chandoviciti¹ deserves to be mentioned in this orthodox period, because, in the work of Jayakīrti Jānāśrayī has been referred to with respect.² Not only that, Jayakīrti adopted the designation and the definition of the Upajāti metre.³ The lower limit of this work can be fixed by the date of Jayakīrti who is no later than 1192 Sam. which is the date of ms utilized by Velānkar.⁴

Now we are to determine the superior date of the work. On examining the illustrative verses which have been collected from the well-known poets, dramatists and the other sources, Mr. P.N. Pillai⁵ and M.R. Kavi⁶ concluded that the work may be assigned to Circa 600 AD. Both of them are unanimous on the point that the Sūtra was written by the king Janāśraya, Mādhavavarman I and the Vrtti by the poet Gunaswāmin, the court poet of the same king.

Among others, i.e., Velänkar, Rāmaswamī Šāstrī⁸ and Sivaprasad Bhattacharyya⁹ the last one is the only person to negate the views of all that Janāśraya should be identified with king Mādhavavarman I of Viṣṇukundin dynasty and should be placed accordingly in the 6th cent. AD.

But whether the work can be dated as early as 600 AD has to be examined in the light of many citations (slipped from the works of these two editors after taking many of them under considerations). The learned scholar picked up-

some of the illustrative verses. The 13 syllabled illustrative verse in Vrtti on the Sütra IV.66 breathes the air of the spirit of Kapphinabhyudaya dealing with Avadāna literature. This verse must have been composed by some Buddhist monk of the 9th or 10th cent. who tried to imitate Sivaswāmin of the 9th cent. Another verse on IV. 45 illustrating the metre Syeni, exhibits the story of Padatādite. This verse can in no way belong to a date earlier than the 10th cent. AD.

Again, the date of the Vittikara can be judged in the light of the use of illustrating verses and can be fixed accordingly not before 10th cent. AD. and of the Sutrakara not before 8th cent. AD.

Therefore the reference of the Sütrakāra in Jayakīrti which will help to build one terminus, would not be militated by this view postulated by this great scholar.

We are now in a position to determine the approximate dates of the two works on metrics written by two poets of Kannada, Nāgavarmā's Chandombhudhi² and Jayakīrti's Chandonusāsanam.

Both these authors belong to same age. Among these two, one written in Sanskrit spares a chapter for Kannāḍa metres and the other written in Kannarese makes a fair provision for elaborated treatment of Kannarese metres. But some chapters at the outset are reserved for Skt metrics.

Nāgavarmā traces his descent from a Brāhmaņa family residing in the city of Vengi. He was evidently a Jaina but would seem to have written under certain Saiva influence. His composition, so far as they are known to us are the following:— 1) Kāvyalokana (2) Kārņaṭaka Bhāṣābhūṣaṇaṃ 3) Vastu Kośa 4) Kādambarī.

Gamyatām Yatheşthameşa Te'ñjali / Stvām cikitsitum ku to manorathah // Tasya te grhitaroşayā mayā / Padatā ditasya dautyamāgatam. // IV. 45. chandoviciti. T.S.S. 163.

^{2.} Ed. by Rev. F. Kittel. 1875.

^{3.} Ed. by H.D.-0. Vellankwed949th Collection. Digitized by eGangotri

Lewis Rice in his preface to Kāvyalokana placed Nāgavarma in the early part of the 11th century as he has been quoted by a Kanarese Grammarian of 1115 AD. Mr. C.P. Brown's Telugu grammar of 1857 laid down that Telugu prosody comprises uniform metres (Nāgavarmā's Aksarachandas) and changing metres (Nāgavarmā's Karnata and metra Kanda metre) employed by Nannayyabhatta in his Cintamani which was written in about 1130 AD. Nagavarma for his kośa utilized Halāyudha Śāśvata, Amarakosa and others. It is worthy of notice that he does not name Hemacandra who died in 1172 AD. The terms Nāki, Nākiga, have been used by Nāgavarmā. Hemacandra used them in Abhidhāna Cintamani in the same of deity but Halayudha omitted them. Lewis Rice in the preface to Kārņataka Bhāṣābhūṣaṇam lays down that the author lived in between 1070 AD and 1120 AD.1 Jaina kavi Salva,2 who was supposed to be living in the late 13th cent, mentioned him in his Rasaratnākara.

In his dictionary Vastukoşa Nāgavarmā puts Rudra and his synonym before Vispu in the same manner as has been done by Halayudha. Our author may be contemporary of Halāyudha" or a bit later than him. Prof. Dīkṣit placed Nāgavarmā of Vengi in about 990 AD half a century later than Pampa I.4

In order to strengthen the view of this scholar we can show that Kannāda Şatpadī elaborately dealt with by Nāgavarmā's Chandombhudhi has been utilized by Jayadeva, the famous poet of Gita Govinda. The astapadi of Jayadeva are nothing but the Satpadi of Nagavarma. The date of Jayadeva has been approximately fixed in 12th century. So

^{5.} Sara Şatpadī

we can safely assert that Nagavarma flourished in the 10th century.

The date of Jayakirti, the author of Chandonusasanam has been approximately settled at the 11th cent. AD by Velānkar.1

Jayakīrti mentioned a host of poets and Sāstrakāra's whom he followed. He was later than Nagavarma, whom he implicitly mentioned in the VII.10.2 The metricist Cūdāmaņi whom he referred to at VII.15 is sure to have 'flourished in about 1000 AD.3

Jayakirti remembered Asaga on VII.7 and Svayambhüdevesa on III.22 and if the last mentioned one be identified with the author of Svayambhūchandah the upper limit of the date of Jayakirti may be fixed at 1000 AD. But in Svayambhūchandah we do not find such as Ardhasamameter as has been ascribed by Jayakīrti to Svayambhūdeveša.

We have seen before, Jayakīrti mentioned Janāśraya and Jayadeva whose dates have been fixed at the 8th and 9th cent. respectively.

The upper limit being fixed more or less with the date of Nagavarma, who flourished in 990 AD and the lower limit being ascertained with the date of the composition of ms in 1190 AD, there is no reason to deny the established opinion of Velānkar, who placed Jayakīrti on 11th cent. AD.

The date of the polymath writer Kşemendra has been settled on more convincing grounds. He is known by hisother works by which he enriched the Skt literature. Ksemendra left indication of his date in the work Suvettatilakam4

^{1.} Ed. Velankara. Jayadam. 1949.

^{4.} Kāvyamālā gucchakam 2.1886 ath Collection. Digitized by eGangotri

and Samayamātīka. In the concluding verses¹ of the former work, he stated that he wrote it in the reign of the king Ananta of Kashmir. In the colophon of the second work we are told that the work was completed during the reign of the same king in 1050 AD. Daśāvatāra is composed in the year 1066 under the patronage of the son of the same king. Bühler² is right therefore in fixing the period of Ksemendra's literary activity in the 2nd and the 3rd part of the 11th century.

Ratnamañjuṣā,³ a work on Skt metrics is written by an unknown Jain author. The work, notwithstanding some peculiarities of its own, follows in many respects, the manner of execution of plan and the spirit of Pingalachandahsūtra. It adopts the designation from the Chandoviciti of Janāśraya. It does not acknowledge any of its predecessors.

Most of the illustrations seem to have been composed by the commentator. Only two of them can be traced, one has been (II.4) quoted from Sakuntalā (1.33) and the other (VI.27) from Bhāsa's Pratijñāyaugandharāyaṇa (II.3).

On examining the contents of the work, Ratnamañjuṣā we can say only that the work has been composed in the orthodox period before the work of Kedāra, in which we can see the sanctioning of certain rules pertaining to the optional lengthening of the short before conjunct consonant absent in the former. One limit of the work can be guessed

Kşemendrenepranayi vipadām harturāscaryakartu/rbhūbhrdbharturbhuvanajayino'nantarājasyarājye III // 40. Suvṛttatilakam, Kāvyamālā II. 1932.

^{2.} Kāshmir Report. P. 46.

^{3. (}a) Samyoge nāpi ma I. 11. Ratnamanjusā cf. ghrādiparah.....I.II. Pingala ch. su.

⁽b) Sanction of hybrid metre restricted only to the metres containing equal number of syllables in each pada.

⁽c) Treatment of Samānam, Pramānam and Vitānam—as of three big genera. V.1.2.3.

Ratnamañjuṣā—Ed. Velankar. Bhāratīya Jñāna Pīṭha, 5. 1944.

from the use of the term Indramālā¹ instead of Upajāti. Janāśraya is the earliest writer to designate it. Therefore our author must be later than Janāśraya.

As regards the treatment of different metres, it can be seen that Hemacandra alone appropriates some of them, which none of the host of metricists give places to. Thus the higher limit of this work can be settled by the date of Janāśraya and the lower limit by the work of Hemacandra. Unless and until we get any fresh evidence, we can assign the work to the orthodox period, i.e., before 12th cent. AD. This work is surely later than Janāśraya to whose school it belongs.² Therefore the work can be dated on 10th cent AD approximately.

We have to reserve for discussion some of the works dealing with Pkt and Apabhramsa metres but which make provision for the Skt metres. In their treatment of these Skt metres they seem to fall in the line of the Skt tradition. Among them Virahānka's is the earliest as we can ascertain from the data available to us.

As regards the life and date of the author we have nothing excepting the date of the ms i.e., 1192 Sam stated in the work. This fixes the lower limit of the commentator who personally handled it.

Velānkar⁴ thinks that there must be a wide gap between the commentator and the author of the text and the difference might be 200 to 300 years. Thus the author can probably be placed in the 9th or 10th cent. AD or even earlier.

Svayambhūchaṇdas⁵ of Svayambhū has been regarded as a standard work on Skt, Pkt and Apabhraṃśa metres. The author of this work has been remembered by most of his followers.

Svayambhū referred to by Jayakīrti is, however, a different author as we have seen before. The upper limit of this work can be ascertained from the date of Jayadeva whom he remembered along with the school of metricians who recognized yati. 1

Out of the 58 authors quoted by Svayambhū we can tracevery few. Among them, Śrīharşa and Mayūra who flourished in the 7th cent. AD.² are much known to us.

The lower limit of this work can be fixed by the date of Hemacandra who referred to Svayambhū in this Svopajūā. Vītti. The developed state of the Apabhramsa literature is clearly discussed in the illustrative works. On considering these points we can place Svayambhū on the 10th cent. AD.

Gāthā Lakṣaṇam or Nanditāḍhya⁴ is a small treatise on prosody solely devoted to the gāthā class of metres. The date of this author cannot be fixed with any certainty. But the following facts may be taken for consideration.

The very name of the author indicates that he was-belonged to a very ancient society of Jaina yatis. The author himself declared that he being a Jaina Yati would only explain sacred metres for sacred Agamas. Again the author declares with contempt that he will not use such Apabhramsa forms such as Jihas Kiha etc. And these expressions are upalaksanam of the Apabhramsa language in general. This contemptuous statement about the aforesaid language indicates clearly that the author wrote this work in an early date when this popular language had no literary recognition.

The lower limit of this work can be fixed with more

 ^{1. 1.144.} Jaadeapingala sakkaammi doccia jaim Samicchanti / Mandayya bharahakāsayaseyala (yava) pamuhā na icchanti.

^{2. 1.144}a and 1.144b.

⁴ Ed. by Velänkar BORI poona vol. XIV. Parts I-II.

S. Verse, 31b. Tahā nandiyattabhania jiha kiha tiha paie natthi.

certainty than the higher limit of it. Ratnasekhara of the 15th century has quoted some verses verbatim from this work without acknowledging the author. Some of the verses can be traced in Hemcandra's Chandonusasanam.2

Candrakīrti, the commentator of Chandokoşa does not mention the name either of the author or of the work. Candrakirti belongs to 17th century of the Samvat era. Hemacandra too flourished in the 12th century and Nanditadhya must have born much earlier.

Velānkar⁸ is right in assigning Nanditādhya to an age when Apabhramsa like other Pkt and vernaculars was regarded as unfit to be exployed by the learned scholars. It is probably at this time say in the 8th or 9th century AD that the Gatha Laksanam is composed.

Our account of the authors of this period would be incomplete, if we take no notice of the celebrated commentator who flourished in this period. They are the celebrated authors like Halayudha and Yadavaprakasa. Date of Halavudha has been fixed with somewhat certainty. Most of the illustrative verses in the commentary Mrtasanjivani are panegyrics addressed to the king Muñia. Under sutra IV. 20 we find the name Vākpatirājas when Lassens assigned to the same period of Muñja. But F. E. Hall identified Muñja with Vākpatirāja.7 Another name Vallabhesvara

has been coined in v. 2. But we cannot identify him. From the deliberation given above, we can infer that Halāyudha wrote the commentary while he was the court poet of the King Muñja of Paramāra dynasty in the 10th cent AD.

Yādavaprakāša is more well known for his many sided contributions in Skt literature than as a commentator. His most widely circulated work is Vaijayantī, a popular lexicon in South India of mediaeval period as the numerous references thereto by the commentators on Kāvyas go to show. His Yatidharmasamuccaya is a digest in eleven sections dealt with the code of conduct of the yatis. The first one is available in printed form and the second is known in MSS. Besides, he was known to have written a number of works on Upanişadic philosophy. Rāmānuja refuted the views of Yādavaprakāša enshrined in the above mentioned works.

Rāmānuja belongs to the 11th century AD (1017—1137)⁴ and Yādavaprakāśa his teacher in his early life must have lived between the 4th quarter of the 10th and the middle of 11th century.

According to Dr. Keith Kedārabhaṭṭa's Vṛṭṭaratnākara which deals with 136 secular metres, was written before 15th cent AD and Mallīnātha used this work. The earliest commentator Trivikrama was earlier than Sulhana and

^{5.} History of Skt literature. P. 417. 1928.

Somacandra who wrote their commentaries on 11901 and 12752 AD respectively. According to Velankar, Trivikrama wrote his commentary on Vrttaratnākara some time in first half of the 12th century. A MS. of Vrttaratnākara dated Sam. 1192 and written on Palm leaves is deposited at Jesālmir. The lower limit of Vrttaratnākara thus is fixed by the date of MSS—the early part of the 12th century.

We are now in a position to determine the higher limit. Weber, in his "Indischestudien" has dwelt on the fact that Vṛttaratnākara is surely later than Halāyudha as the verse V of the 1st chapter is a direct attack against the view of Halāyudha who divides metres into three sections—Ganacchanda, Mātrācchanda and Akṣaracchanda.

Sīvaprasād Bhaṭṭācārya⁶ has shown how the familiarity of Kedāra with Yādavaprakāśa has been discerned in former's verses I.6, I.9, I.10d. These verses read like direct echoes of Yādavaprakāśa's introductory verses.⁷ In good many

^{7.} The same verses—Ma ya ra sa ta ja bha na la ga.....etc. are found in all the printed editions of P. Ch. Sūtra with Halāyudha's Commentary, thereby indicating these verses belonged to Halāyudha's Vṛtti. Indische Studien VIII; NSP. Kāvyamālā 91. 1938; Haridas Sanskrita Granthamālā 1947; ed. by Sītānāth Śāstrī. 1342 Vangābda. Only Bibliotheca Indica series did not contain these six verses (ed. Viśwanāth Śāstrī 1871). In the concluding page, of this edition there has been an annexe, where in the estimated enumeration of the sūtras of the Texts concerned, these verses are included. They are of course converted into 12 Sūtras. (cf. Ma Ya dvādaša). In some MSS Weber had noticed this type of adaptation on P. 210. I.S.VIII "(In R. Wird Jeder der sechs vers des 1 als der zwei sutra am schlusse der Werkchens demselben deren zwolf zu geteilt finden.)"
CC-0. Jangāmwadi Math Collection. Digitized by eGangotri

cases Vittaratnākara follows Yādavaprakāša. That the former used the latter has been hinted at by Nārāyaņabhatta under Vrttaratnākara I. 9. (Taduktaih dīrgham Somyogaparam)etc. The upper limit of Vrttaratnakara can be fixed by the date of Yādavaprakāša2 we can place Vīttaratnākara in 11th cent. AD.

The respective chapters of the Agnipuranam and Visnudharmottarapuranam have been condensed in the metrical paraphrase of the Sūtra text of P. Ch. Sutra. Text contents of the respective chapters dealt with metrics in Garuda purāņam³ and Brhadnāradīyapurāņam⁴ are grown out in a

In some Mss, these verses are found along with the original text where there is no commentary, indicating as if it belongs to original text. The MSS in ASB Coll. (III.F.294) contained both the verses at the beginning and the total count of the number of sutras where 6 verses=12 sutras are taken into consideration. One Skt college collection MSS (chanda No. 6) reads the verses at the beginning of the text, though it does not count them among sutras which are numbered in MSS. Prof. Bhattacarya has dwelt on the fact that these parts in no way can be regarded as belong. ing to original part, because of the first expression (Jayati Pingalanaga) on which no commentary was written. And it also may be fact no Sütrakāra of renowned faith can do never such self praise. It may not be improbable that these verses are belonged to Yādavaprakāśa's Comm. In a MSS(Madras or MSS Lib. D. 901) thereof both these verses are found but editor thinks they are taken from Y.P's commentary. But Halayudha and Yadavaprakāśa lived in South and the former was more famous as commentator than the later. It is not totally improbable to transfer these verses under Halayudha's comm. from that of Yādavaprakāśa.

manner adopted by Kedāra. Garuḍa Purāṇam not only arranged the subject matter after the model of Vṛttaratnā-kara; sometime it copied down the ślokas from the works of the latter.¹

Bṛhannāradīyapurāṇam in twenty ślokas dilates on the few rules on prosody which appears to be orthodox in spirit² but not in feature. While enumerating on the rules of six pratyayas its adaptation from Vṛttaratnākara is so faithful sometimes that it can be charged with for his slavish plagiarism.³

On examining the contents of the respective chapters of these purāņas, on which the unquestioned dominance of Vṛttaratnākara is clearly discerned we are to note unhesitatingly that they have been composed after the appearance of the medieval standard work Vṛttaratnākara.

Vuttodaya⁴ the only extant work in Pali language deals with the Cl. Skt. This work does not, strictly speaking, enjoy reputation as authoritative but deserves notices because it is directly modelled after the text Vrttaratnākara with considerable plagiarism⁵ of the theoretical consideration of general prosodical principles.

In one hundred and thirtysix verses6 this work like

^{5.} Para pādādisamyoge yo purvoc guru vakāro laghu sa kvacit vionyyo Tadudāharaņam yathā—cf. Vr. Rat. Pādādi......

^{6.} Cf. Vr. Rat. Şadadhyayanivaddhasya chandso'Syaparisphutam pramānamiti vijñeyam Şattrimsadadhikam Satam—India, off. Librarys MS—Mr. Childer's presentation contains 139 verses. Burmese MSS also contains 136 verses. Mr. Minayeff's two MSS published in 1869 by Indian Academy of Sciences of St. Petersberg have same number of verses.

Vṛttaratnākara distributes its subject matter among the six paricchedas.

In its treatment of Upajāti metre Vuttodaya adopts Kedāra's version in a manner as if it has been reproduced in Pali language. The date of Samgharakkhitas, the author of Vuttodaya, therefore, can approximately be settled from the internal evidence supplied by the work itself. It can be shown from the given extracts that the author not only followed closely Kedāra in its treatment of fundamentals and general arrangement but copied some of the definition adverbatum. Therefore it is not improbable that the Buddhist monk has the text of Vrttaratnākara before him when he composed this Pali work. This will supply us one terminus to his date.

The other terminus is given by the date of the earliest commentator Nava Vimala Buddhi who wrote Vuttodaya Tīkā in Pagan during the reign of Burmese king Kyatswa in Circa 1212 AD.

In the same period in the same spot we have been supplied with a number of commentaries such as Chandosarattha and a gloss on it by Sadhamma nana, Chappaccaya and Vccanthajatika by Vepulla.¹

Accepting the date of Kedāra as the 11th cent. and allowing one century to elapse between the author and the commentators we can roughly fix the 12th century as the approximate date of this Pali work.

The earliest commentator of the Vıttaratnākara is Trivikrama Surī who wrote the Vıttaratnākara Tātparya Tīkā. Trivikrama himself declared that he hailed from the family

Anantorodirita lakkhana pāda vimissa upajātiyo ta evam kil' annasu vimissitasu.

³ References have been supplied my G. E. Eyer, P. 370 JASB. Vol. XLVI. Another comm. entitled kavisāra with a vṛtti on it has been supposed to be composed during the reign of the pegu Monarch, Dharmarājādhīrāja Çirca 1385—1421.

of Angirasa¹ who has been settled at Vrddha Vālabhi of Gauda family. This very term reminds us one of the Bālabalabhi in Gauda in connection with Bhāvadeva Bhaṭṭa of the 11th cent. AD who has been known as Bālavalabhi-bhujanga.

Lower limit of his date can be approximated by the date of the MS. of the author's Uddyota on the Kātantra. It is dated at Sam. 1221.2 The higher limit can be fixed by the date of the Rājasekhara whose Chandasekhara has been referred to by Trivikrama in many places.3 The date of the former has been settled on the 1st quarter of the 11th cent. AD.4 Therefore Trivikrama might have lived in the 12th century.

Sulhana left his date mark on his own composed illustrations. While illustrating Urddharsin metre, Sulhana gives the date of his self composed verse Sam 1246.⁵ In another verse we have the reference of king Vindhya Varman, the successor of Ajayavarman at about 1160 AD.⁶ Therefore Sulhana must have flourished in the last quarter of the 12th cent. AD.

The polymath Jaina writer Hemacandra directed his many sided activities to the field of the metrics. His only

available work in this field is chandonuśāsanam¹ which dealt with Skt, Pkt, and Apa. metres and which is accompanied by a Vitti of his own, i.e., Svopajña Tikā. Another work Chandascūḍāmaņi is existed by the name only.

About this versatile scholar we have more authentic materials than we have with regard to the most of the writers. The biographical and other details are to be found together in Bühler's erudite but reliable work on this author. Hemchandra is famous in the history of his sect because of his endeavour to induce Jayasimha Siddharāja one of the most powerful king of the Gujarat (AD. 1094–1143) in favour of the Jains and to convert Kumārapāla into Jain.

Born in 1089 AD. He became a Jaina novice and was ordained as Surl in 1110 AD. After the conversion of Kumārapāla and enjoying the royal patronage (1125. AD) he lived in Anhilvad patan for a great part of his life. It is due to his devoted energy, Jain literature got its impetuous upliftment in the 12th and the 13th cent. in Gujarat. Such a prolific writer ended his busy career in 1173 AD at the ripe age of 80.

To determine the date of Pkt Paingalam is not so much difficult now a days. This work is one of the most important documents of Mediaeval Indian literature not only for the languages used in it, but also for the references of the historical facts and figures enshrined in the illustrative verses. About this work and its time, we are pretty certain that we are with regard to other writers on metrics. That is why this work has been treated differently by the eminent scholars, who tried to lay down the approximate date of

^{1.} cd. Velankar. 1948. NS. P.77.

the compilation of the work from different angles. Examining the data collected from the illustrative verses and in consideration with the language from the philological point of view, they are decided more or less on one point that the compilation has taken place in the period between the 14th and the 15th century or between the 15th and 16th century.

Of these scholars, Dr. Ghosal¹ and Dr. B.N. Vyas² devoted their full-fledged energy and examined minutely this work from every corner of its possible issues and they agree among themselves in determining the upper limit of the compiler by the date of Hammir who is mentioned in the verse No. I.147.³ Dr. Ghosal contends that if that historical figure is Hammira of Ranthambara, the date will be after 1301 AD when the said king died.⁴ But if this figure is the same with the king of Mewar the date will be comparatively few years later, i.e., 1301—64. Thus the upper limit of the king being fixed, we are to examine the lower limit.

Dr. Ghosal makes this limit to be determined by the

date of Laksmidhara Bhatta, the commentator of Pkt. Paingalam whose date has been coined in his work, as Sam. 1657. On the basis of these data for the higher and lower limit, Dr. Ghosal fixed the date of the work approximately between 1400 AD and 1500 AD, which however would not militate the views of Dr. Chatterjee and others.

Dr. Vyas, on the other hand, fixed the upper limit a bit earlier, than the date of Vāṇī Bhūṣaṇam of Damodaramiśra, whom Lakṣmīdharabhaṭṭa quoted many a time in his commentary. Date of Vāṇī Bhūṣaṇam can be ascertained by the date of king Kīrtisiṃha referred to in an eulogy addressed to the king.²

This Vāṇī Bhūṣaṇam, again mentions one Ravikara³ who is supposed to be the commentator on Pkt Paingalam and was born in the same family of Damodara. If there is a gap of 25 years between Ravikara and Damodara, the date will be fixed at the 14th century.

Now these opinions may be reconsidered afresh. Because like Vānī Bhuṣaṇam, Chandokoṣa of Ratnaśekhara follows Pkt Paingalam in the appropriation of the Pkt, and the Apa. metres only. H.D. Velankar⁴ in his discussion on the metres of Chandokoṣa and Pkt Paingalam, has laid down the date of birth of Ratnaśekhara. He was born in Sam. 1372,⁵ and his other two works, Śiśupālacarita and Guṇasthāna Kramāroha were composed in Sam 1428 and 1447 respectively.

Velankar asserted that both these works may be assigned to the 14th cent AD. And if the date of birth of Ratnasekhara is 1378 Sam=1315 AD, there is every probability for the author to compose his work in the last part of the 14th century, a few years before the completion of the work of Pkt Paingalam. Therefore we find no bar in inferring that the Pkt Paingalam has been compiled during the first half of the 14th century.

Vāṇibhūṣaṇam the work on Skt and Pkt metrics was written in Skt language by Damodaramiśra who was born in Dīrghaghoṣa kula. That he lived during the reign of the King Kīrtisiṅgha (1360-1400, AD) has been said before. His date tentatively has been fixed in the last half of the 14th century.

Incidentally, reference may be made of the author of Chandomakhānta of which nothing pertaining to the author is left. Gaṅgādāsa, the Chandomañjarīkāra mentioned one Puruṣottama Bhaṭṭa, the author of Chandogovinda.¹ But Chandomakhānta² is another work of Puruṣottama Bhaṭṭa. One of the Murshidabad editions of Chandomañjarī contains a magnificent eulogium of Puruṣottama. Chandomakhānta contains Gīti metres which bear close semblance to those of Jayadeva³ and they are the laudatory verses addressed to Śiva and Pārvatī. As for the date of the work we can assign a period between Jayadeva and Gaṅgādāsa. It is interesting to note here that while Gaṅgādāsa mentioned Jayadeva, Puruṣottama did not.

The next prosodist of our concern is Gangādāsa whose Chandomañjarī has had wide popularity in the whole of East India and his undisputed authority has been recognised

^{1.} I. 20. ed. Gurudāsa Vidyānidhi. 1939.

by all. Gangādāsa came of a well known Vaidya family. His father was Gopāla Dāsa to whom is ascribed the voluminous work Cikitsāmṛta. After the death of Gopāla Dāsa, Kṛṣṇadāsa and Gangādāsa born of Santoṣa together completed the incomplete work of his father. P. K. Gode, however fixed the date of this celebrated author within Circa 1300—1500 AD. The results of our investigations, however, do not agree with Gode's conclusions.

The upper limit of the work can be determined by the date of the Pkt Paingalam from which work it appropriates a number of metres.³ He is surely later than Jayadeva from whom he has quoted⁴ a verse. The lower limit can be ascertained by the date of Laksmīdhara Bhaṭṭa who has quoted Chandomañjarī in good many places.⁵ Gaṅgādāsa again is cited in Kalāpadīpikā of Puṇḍarīkākṣa Vidyāsāgara under Bhaṭṭi VIII. 131. Puṇḍarīkākṣa flourished in the 15th cent. AD⁶ when Gaṅgādāsa was an author of established reputation.

With a view to corroborating our conclusion about the date of Gangādāsa, we may also refer to a work on Kavišikṣā ascribed to Gangādāsa where a verse from Dhūrtasamāgama was used for illustrative purpose. This verse quoted can be traced in the drama of Kavišekhara Jyotirīšvarācārya. Accor-

 (b) S. P. Bhattacarya in his introduction to ed. ŚrIdhara's Comm. P.XXX is inclined to take Pundarīkākşa Vidyāsāgar as a commentator of Kāvyaprakāśa. And assigned him to the early decades of the 15th, century.

CC-0. Jangamwadi Math Collection. Digitized by eGangotri

ding to the verse V. 3 of that drama it is found that the dramatist was patronised by Muhammad Tughlak. His time falls, therefore, in the 2nd quarter of the 14th cent. AD. So the earliest date that can be assigned to Gangādāsa is 14th cent. AD. This can be substantiated by the date of the Rāmcandrakavi Bhāratī who quoted from Chandomanjarī without acknowledging it. This commentator flourished in the 15th century. Therefore, Gangādāsa must have flourished before 15th cent AD.

Śrutabodha, a short but apocryphal work of 40 stanzas, has been traditionally ascribed to Kālidāsa but some of the mss fathers it to Vararuci, where the date of the ascribing is stated as Sam 1763=1638 AD. It has been known in MSS. since the 16th cent. Śrutabodha is not known to Chandomanjari the popular manual in the 14th century. In the 16th century Śrutabodha was a popular figure even in the far south. Nārāyaṇabhaṭṭa, quoted from it acknowledging its very identity under Comm.I.II Yasya pāda... ...etc. (Śru. 4).4

Rāmacandra Kavi Bhāratī extracted verse from Śrutabodha while commenting on the Sūtra I. 4. .5 Therefore Śrutabodha is sure to flourish during the interval between Gaṅgādāsa and Rāmcandrakavi Bhāratī in Circa 1350— 1400 AD.

Vrttaratnāvalī, a short metrical exposition, written by one Venkateśa, son of Avadānasaraswatī. In some MSS the work is ascribed to Kālidāsa which may be supposed to be the non de plume of the author.

One Avadānasaraswatī is the author of the Vedānta Šatašlokī. Sūryapaudita, the famous commentator of Vījagaulita also wrote a commentary on the Vedāntašatašlokī—in Šaka 1460—1538 AD. when he was thirtyone years. The same should also be the period, when the literary activity of Venkateša is in full swing.

Praśnottararatnamālā is another work of Venkateśa (Govt. Or. MSS. Lib. Des. Cat. D. 13173) in which we have completed genealogy of the author's maternal family. In that work we are told about his father whose grandfather-in-law, at the request of Sāyana composed Ayurveda Sudhānidhi. If this Sāyana is identical with Sāyanācārya, the commentator of the Veda who flourished in the middle of the 14th century and is the contemporar of the author's great grandfather, our author might have lived in the 1st quarter of the 15th century.

Candrasekharabhatta, the son of Laksmīnāthabhatta, tells us expressedly the time of composition of his voluminous work Vṛttamauktikaṃ¹. The work has been set in two parts dealing with mātrāchandas and others each separately paged and dated. The second part is posthumus and has been completed by the author's father Laksmīnāthabhatta² who dedicated it to his son a year later in 1676 Samvat. Besides this work, he wrote a commentary on Pkt Paingalam entitled Pingala Bhāvodyota³ in 1673 AD which created

much fuss among the scholars as to the nature of the text on which it comments. A commentary on Chandomañjarī entitled Chandomañjarī Jīvanam¹ is his another work.

A little bit earlier is Vrttamuktāvalī, a work modelled after Vrttaratnākara. This work has been utilized by Weber in his scholarly dissertation on Pingala Ch. Sūtra. This is dated as Samvat 1631-1575 AD.

Vṛttadarpaṇam of Bhīṣma Miśra has been composed after Vāṇī Bhūṣaṇam in the model of which its contents have been arranged. But unlike the later it defines the mātrā metre in terms of total number of mātrā. In many places it quotes from its model work.²

Chandoratnākara, an elementary treatise on Skt metrics consists of 4 chapters. It has been ascribed to an author Vasudeva Sarvabhauma Bhattacarya. The work extends to folia 17 appropriates Gīti metres. The work has been dated as Śaka 1622.3

Rāmapāņivāda, the author of Vṛttavārtikam⁴ as appeared in the introductory chapter of Uṣā-Nirudh ed. by C. K. Raja, was a great scholar and poet and was favourite in the court of the Malavar king. He lived under the patronage of the king Malandavarma of Trivandrum—Sam 1763=18th century.⁵

Rādhādāmodara, the author of Chandaḥkaustubha will survive by the name of his worthy desciple and commentator Baladevavidyābhūṣaṇa, whose name was associated

with Gaudia Vaişņava movement. He flourished in the 18th century, which can be known from the date mark left in a commentary on Rūpagoswāmin's work—Şadsityuttaroşodasasatiganite sake tu tikāyāh nispattih......) Sak. 1686 or 1764 AD.

A pun in the first verse of his Sāhitya Kaumudi refers (according to his own Tippana) to Gajapati Pratāparudra of Utkala or Orissa. In the concluding verse of the same text Baladeva was declared as a pupil of Rādhādāmodara Dāša and Gopāladāsa alias Rasikānanda.

Rādhādāmadora in the introductory verse of the Chandaḥkaustūbha prayed for the grace of Murārī. Baladeva identified Murārī with the father of Chandaḥkaustubhakāra¹ while explaining the word "Gajapati" in the next line 1.2b. Baladeva contends that he is no other than Gajapati Pratāparudra, the king of Utkala.²

Date of Vidyābhūṣaṇa being settled with exactitude, Dāmodara can safely be assigned to the 18th cent, when Baladeva flourished. Chandahpīyūṣa is another late work presumably of Eastern India of which only the codex is found in the collection of BORI.³

This work is ascribed to one Jagannātha from whose own account we come to know that our author was born of Subhadrā and Rāma, the son of Vidyādhara. His wife was Gopālī and the preceptor was Buddhimat who was well-

 [&]quot;Arcita Nayanānando Rādhādāmodara Guru jiyāt"—This verse is found in the introductory verse of his commentary on Chandokaustuva—Page I Chandokanstave 457 Gaurabda.

known figure in Nilalohitapura.1

The date of the author of this work can be approximately settled from the one limit that is from the date of copying i.e. 1849. Coined in the post colophone line² and the terminus ad quem can be furnished by the latest figure Setukāra Haribhāskara whose famous commentary on Vṛttaratnākara has been utilised not less than four times.⁸ Bhāskara Setu has been dated 1676 AD.⁴ Considering these limits it may be presumed that the work has been written in the last half of the 18th century.

Duḥkhabhañjana Kavi a poet of 19th century as has been asserted by Kṛṣṇamācārya, is the author of Candra-sekharacaritam. But his only extant work of Vāgvallabha is a treatise on metrics. The commentary of this work has been written by his son Deviprasāda, who left the date mark of its composition in the commentary. "Vānāṣṭana-vabhuvarṣe" i.e., 1985 Samvat 1910 AD. Accepting this only source for the date of this work, it can be presumed that the work might have been composed in the last part of the 19th century.

The author of the work Chandomṛtalatā⁷ is a Napalese Buddhist who is sometimes referred to as AmṛtaBhikṣu.⁸ Amṛtānanda has been described as the author of a Buddhist

hymn' and a translator of the two portions of Divyāvadāna in Napalese language. One of the mss. of the last mentioned work in Bendall's Catalogue has been coined with the date mark as NS. 963, i.e., 1843.²

This Amṛtānanda, as Mm. H.P. Sastri, (NS. 14. 963, i.e., 1843) presents before us, is Brian Hodgsen's Pandit who prepared two copies of Buddhacarita which Cowell has utilized for his edition. Hodgson's ms. is written in Newari script and has been marked with the date 950 NS—i.e., 1830 AD and contains a complete verse, in which the copyist confessed that he wrote additional three sargas of Buddha Caritam.

In the same codex twenty four lines⁴ are written in Vernacular language in praise of Rajendra Vikrama, the king of Nepala and his son Surendra Vikrama who ascended the throne of Nepal in 1816.⁵

From the facts adduced above, we can place our author as a copyist in the 1st half of the 19th century whose very profession has been detected clearly in the work Chandomrtalatā.

Vṛttaratnāvalī has been composed by Cirañjīva, a prolific writer of Bengal whose works, the Vidvanmodataranginī, the Mādhavacampū and the Kāvyavilāsa had been enjoying a wide reputation in the literary circle.

Our author was an inhabitant of West Bengal. His

^{5.} History of Nepal. Dr. Wright. p. 284.

Vṛttaratnāvalī is a short exposition of Sanskrit metrics. It transpires that his real name was Rāmadeva but he was well-known by his pet name Ciraũjīva which was given to him out of affection by his uncle.¹

This Cirañjīva was the son of Rāghavendra Śatāvadhāna Bhaṭṭācārya, who was a student of Bhavānanda Siddhāntavāgīśa.

This celebrated prosodist enjoyed the patronage of Yasovanta, the noble chief, variously referred to in the illustrative verses² as Gauda king, who has been regarded to be a native of Bengal, the Nawab Dewan of Dacca.

Yaśovanta was the Nawab Dewan in 1733 AD. In his Kāvyavilāsa, Cirañjīva refers to³ another king Jayasimha who reigned perhaps in 1714 AD. Therefore our prosodist must have flourished in the first half of the 18th century.

We would close our survey by introducing Gangādhara Kavirāja whose versatile scholarship enriched the field of Skt metrics by no less than three works. Born in Jessore in 1205 B.S. (1720)⁴, Gangādhara showed his uncommon skill and aptitude in adopting every kind of scientific literature. As a Physician his special propensity for diagnosis and treatment became almost legendary.

His special studies on Agnipurāņa urged him to write three commentaries on Alankāra (Prācyaprabhā', Chandas (Chandaḥ sāraḥ)⁵ and on Ayurvedīya chapters of this encyclopedic work. Of the 40 works composed by him, nearly 4 have been dealt with metrics.

Most of the mss. retained the name Ramadeva, vide, I.O. catalogue.
 Vol. III. PP.343. Vidvanmadotarangini—Tātograjamamativātsalyatvācciram cirajīvataya juhara.

Vilāsinī by Gangādhara Kavirāja—Behrampur. Saidabad, 1287 (1879 AD).

Gangādhara denied the authorship of Dvyaipāyana Vyāsa to Śrī Bhāgavad Gītā and wrote a voluminous work on this. Most of his works have been dedicated to Lord Siva. But two of his works Govardhana Vardhana and Rādhākṛṣṇa Vardhana are sufficient to speak in favour of the fact that he was not the Sivaite.

His commentary on Carakasamhitā entitled Jalpakalpataru is a voluminous work comprising 600 thousand ślokas.

His Bahuvivāharāhitya and Vidhavāvivāha is the works which give recognition of his liberal attitude as a social reformed. Bengal lost one of her lumiere in 1292 B.S. (1885 AD).

We have now practically closed our survey of the Principal prosodists deserving mention. Now we shall endeavour to concentrate on some prominent commentators who came in the way. But hardly any of these works except those of Bhāṣyarāja with an account of which shall close our survey, deserves the merit for any special mention.

Vṛttaratnākara pañcikā is a lucid exposition on the Vṛttaratnākara by Rāmacandrakavi Bhāratī. He was born in Vṛrabaṭikā village and he went to Ceylon. Being converted to a Buddhist he domiciled there for the rest of his life. He has been assigned to the reign of Parākramabāhu I in the Buddhist era of 1744 AD², by some eminent scholars.

But a more precise dating is possible. Because, the colophon verse of the printed edition is marked with the date of Buddhist era 1999. AD.³ The latter is more reliable as from the illustrative verses we are acquainted with the

name Rāhula who was a well-known figure for his literary products during the reign of Parākramavāhu VI (1412-1468).¹

Archeological commission in Ceylon also confirms the same² date.

Considering the authenticity of the archeological report and examining the references found in the commentary, we can unhesitatingly contend that Ramacandra flourished during the reign of the king Parākramavāhu mentioned above.

The Celebrated Nārāyaṇabhaṭṭa left his own account in his colophon verse. He was the son of Rāmeśvarabhaṭṭa and his geneology is carried further upto Govinda, Aṅgadevabhaṭṭa and Bhaṭṭa Nāgapāśa. While he was residing in Kāśī he wrote this commentary.

Prof. S. P. Mukherjee⁴, described him to be a southerner and to be well acquainted with the work of Yādavaprakāśa. The date of the composition is coined as "Vikramaśake Dvikhaṣaḍbhū.....Sanmite......"1602. The particular expression Vikramaśake creates much confusion among the scholars. That is why, they differ among themselves in the interpretation. Velankar accepts the reading in terms of Śaka and that is why date is fixed by him on 1602+78 = 1680 A.D. But the printed edition of the text⁵ and the descriptive note of the mss⁶, accept the reading in Samvat

which will fix the date to 1602-57 = 1545 A.D.

This seems to be an accepted version which needs no denial. The date of the Cintāmaṇidaivajña, who wrote commentary entitled "Sudhā" on Vṛṭṭṭaṭtnākara is not difficult to determine as the author left its mark in the pre-colophon verse—Nandavānaśara bhūmitaśake—1559 saka=1637 AD. Cintāmaṇi was the son of the well-known astronomer Govinda who was the resident of Vārāṇasī and he himself wrote a work Prastāracintāmaṇi.3

"Bhāskarasetu" or simply "setu" is another commentary on Vṛttaratnākara by Haribhāskara. The work is widely circulated and its popularity can be estimated by its entry in almost every catalogue of mss. collections.

The author was the son of Śrīmadyāji Bhaṭṭa, grandson of Hari Bhaṭṭa and great grandson of Puruṣottama Bhaṭṭa. While residing in Vārāṇasī the author wrote this commentary. Date of this commentary can be fixed according to the author's own declaration placed in the colophon verse, Saṁ. 1732=AD. 1676.2

In 18th century, Divākara Bhaṭṭa the son of Mahādeva Bhaṭṭa wrote the commentary on Vṛṭtaratnākara entitled "Vṛṭtaratnākarādarśa". The codex of ASB Library is incomplete. But from the ms. (I.O. 1555b—Part II 1889) we have the date mark as 1740 AD.³

150 ORIGIN AND DEVELOPMENT OF SANSKRIT METRICS

We would close our account of chronology of the commentaries with a dissertation on the date of Bhāskara Rāya.

This versatile scholar unlike his predecessors, do not offer any trouble about his date. In most of his works, with which we are directly concerned, he left the date of the composition.¹

Aufrecht mentions that Gambhīrarāja resided in Benaras in 1629 AD and also described him as the author of 28 works. He is versed in Vedic and secular literature.

The Bhāskara Rāya tells us that he is the son of Gambhīrarājadīkṣita. He was the disciple of Nṛsiṃha and Śiva Datta Śukla and was well-known figure in² the field of Tantric literature. Numerous outstanding works on Tantra topics, are available in print. His Madhurāmla Kāvya has been edited by Devasthalī in the Oriental thought series, Nāsik, No. 2.

Bhāsya Rāja's versatility can be estimated by the number of works composed by him. He has commented on six Upanişads such as Kāṭhaka, Kena, Jabāla, Tripurā, Mahopanişad and Muṇḍakopaniṣad. On metrics he is credited with more than four works.

From his own version we come to know that at the age of 17 he wrote "Kaustubha", Mrtasañilvanl when he

was 20; then he wrote Vadakutuhala and at the age of 50 Vṛttacandrodaya¹ was composed. This last mentioned work is coined with the date mark "Dviśaranayaśaka", i. e., 1652 Sāka=1730 AD. His Bhāsyarāja, commentary on Pingalachandaḥ Sūtra was written in—"Guṇa nidhimuni bhūmitavikramaśake varṣe"=1793 San=1737 AD. i. e., 7 years after the previous work.² From the facts adduced above, it can be said that the literary activity of this polymath writer was concentrated in the first half of the 18th century.

(VI. No. 774) entitled Mṛtasañjīvanī ascribed to Bhāṣyarāja Beginning—Vṛttaratnākaravyākhyā bhuyasyahsanti yadyāpi Tathāpi mṛtajīvinyāh kalām narhanti Ṣoḍaśim, which is described to be composed in Site Sahasya janite munipakṣartubhumite (1627 Saka) Sake'vde pārthive pūrņa.....tena tuṣyatu.

 Aufrecht (P.I.P. 670) noticed one Abhinavavrttaratnākara Tippani by Bhāskara with a comm. on it by Śrīnivāsa, who is the author of Alamkār Kaustubha, Kāvyadarpaņa and Chandoviciti.

CHAPTER-II

METRICAL SPECIMENS FOUND IN EXTANT LITERATURE

I. VEDIC LITERATURE

For the history of chronological development of Skt. metre a clear and intensive study of the metrical specimens employed in the extant Indian literature is necessary. We therefore engage our attention for finding out metrical peculiarities inherent in them. With a view to having a clear conception of those sustained peculiarities we have to enter into the domain of Vedic literature which represents the earliest available phases of Indian metrical composition.

The term 'Vedic literature' in its versified form, denotes in wider senses what comprises the Rgveda, the Atharvaveda, the matrical portion of the Yujurveda, Bhāhmaṇas excluding their prose portions, scientific literature preserved in its metrical forms and the Upaniṣads, subsequently leading up to the Epics and classical literature. The ensuing note which will give a vivid picture of the actual representation of the Vedic metres would ultimately serve double purpose: finally it would show now the relevant applied metres bear points of coincidence with the extant theories relating to metrical principles and at the same time would be regarded as the forerunner of classical metres so far as rhythm is concerned and that would enable us to spin perfectly the chronological yarn of the Skt. prosodical texture.

Of the three sections of Vargas of the Vedic metres only the first two taking in fourteen classes beginning from Gāyatrī and ending with Atidhṛti¹ have been used in the Rgvedic collections. Again of the fourteen classes of metres

Sarvā dāśatayisveta uttarāstu subheşaje XVI 55.
 Rk PrātiśākhyagædwPcNM-Slastrilef90n. Digitized by eGangotri

circulated in the Rgvedic scriptures, seven are selected to be principal one which served as the basis for creating new as well as mixed metres. These phenomena are seen working largely in the process of development in the field of classical metres.² These are derivative and mixed metres.

Besides the two Vargas mentioned above there have been used, three classes of metres two of which have been designated according to their constituent parts i.e., number of feet that they contain³ and the third one consists of mixed or hybrid metres.

Theoretically, the smallest class of metres used in the extant Rgvedic verses seemed to be Gāyatrī containing twentyfour syllables in a stanza.

Metres, smaller than Gāyatrī can scarcely be traced in the Rgveda, say, of course Ekapadā and Dvipadā types. Incidentally, we can mention here that all the illustrations pertaining to classes of metres smaller than Gāyatrī can be found to be employed in the other Vedas. That is why we find them totally absent Rganukramanī which preserved the Rgvedic tradition. But Rkprātiśākya speaks of the classes smaller than Gāyatrī without placing any corresponding illustration.

CC-0. Jangamwadi Math Collection. Digitized by eGangotri

The illustrations given by Sadgurusisya are mainly drawn from the Yajus and Sāmas¹, whereas in the Atharvanas we can trace these five classes in their forms.²

The verse cited for the Supratistha class by Sadgurusisya in his Vedārthadīpikā is not originally a verse complete in itself but a diminutive form of Gāyatrī as has been described by Sāyanācārya on the basis of Rganukramanī.³

There are in the Rgveda six Ekapadās and one hundred and twentyseven Dvipadās in all. 'Nūnam atha' has been posited by Sadgurušiṣya as a verse for an Ukta class because of the fact that Aitareya Āraṇyaka describes it as Ekapadā. Mādhavācārya while commenting on the same, used the

^{4. &#}x27;Ekapadāstu Šatproktaḥ' -Anuvākānukramaṇī, Ibid, P. 55. Verse 8. Rv. IV,17, 15; Rv. V, 41, 20; Rv. V, 43, 17; RV. VI, 63, 11; Rv. 10, 20, 1; As for 'Dvipadās' in the verses of Chandosamkhyā, the reading is 'Daśasaptaḥ', which does not tally with the actual figure 127. Perhaps in any way, the middle digit is dropped, before this index has been made prepared.

Yāska except solitary verse in the Vimada finds no Ekapadā type throughout the ten mandalas. cf. Prātiśākhya XVII 25.

^{5.} Nünamathet yekapadjamwai 2 Math 1 C2 || A ii ph A Pigpiz 449 y B ii ph padi 1876.

phrase 'Kacid' as if the verse may not exist in that very form. In fact, what Ait. Ar. describes, is not a whole stanza but only a constituent part of a mantra bearing the metre 'Kakupnyankusira', the definition of which runs as 'Triṣṭubh Jagatī Catuska'. Needless to say, the aforesaid Ekapadā has not been alluded to six Ekapadās enumerated by Anukramanī. The smallest class of metres recognised in classical Skt is however Uktā containing four syllables and the largest one is that which exceeds even one hundred four syllables.

In its extensive use in the Rgvedic composition, Tristubh stanzas outnumbers Gäyatrī. That is why, the very norm has been designated as Tristubh, as it is 'Tīrṇatamaṁ' 'stutataṁ'—because of the fact 'Gāyatryādibhyaḥ Vahutvāt'—as has been remarked by Durgācārya⁵ while commenting on the phrase 'Tīrṇatamaṁ' laid down by Yāska.

Jagatī however follows Gāyatrī.⁶ Next to them stands Anuştubh in respect of frequency.⁷ About the number of

^{6.} Jagatī—1344, Catvārimsat tathāstau ca tathā cāpi Satatrayam Jagatīnamiyam Samkhyā Sahasram prakīrtitam [151] Chandah Samkhyā. The total number of Jagatī given in this verse does not tally with actual number, the sum total of Jagatī verses appeared in each Mandala. Therefore, the actual figure is 1344 which differs from the given verse.

Anuştubh—856. 2. The verse in Chandosamkhyā enumerates 855
 i.e., Anuştubham Śatanyaştam Pañcaśatpañcasamyutam.
 CC-0. Jangamwadi Math Collection. Digitized by eGangotri

other classes it is seen thus:

Uşņik appears—344 times: Bṛhatī—180 times; Paṅktiḥ 248 times¹; Atijagatī—16 times; Śakvarī—20 times; Atišakvarī—10 times; Aṣṭhi—6 times; Atyaṣṭhi—83 times; Dhṛti—2 times and Atidhṛti has only one occurrence.²

The smallest metre extent in the Rgvedic collection is the Dvipadā Gāyatrī³ containing sixteen syllables. This metre has not been alluded to in the Rgveda Prātiśākhya according to which the smallest mantra in the Rgvedic collection is one which contains nineteen syllables. Both of these however belong to Gāyatrī class.

The metres of the Rgveda can be grouped into Sama, Ardhasama and Vişama types.

Samas is the one of which the constituent parts of the stanza are of equal length. This type includes:—

- a) Tripadā Gāyatrī⁵, having eight syllables in each of the three parts, Dvipadā Gāyatrī⁶ and Virāṭ Gāyatrī.⁷
- b) Among Usnik group only one specimen of the pure

The same case with the figure of Panktin; The verse of Chando samkhyā runs thus:—Śatāni trīni Panktinām dvādaśabhya dhikāni tu // 3.

^{2.} Cf. verse, 6, 7, here too verses differs from the actual use. The authenticity on this very text is doubted, because of the omission of the comm. of Sadgurusişya.

^{7.} Dvipadā Gāyatrī a) 12—12—also called Dvipadā Jagatī Rv. VIII. 46. 13.

b) 8—8—no manual on Vedic metre has made provision for it; yet it can be found in Rv. IX 67, 16-18. cf. Sāyaṇa: Pavasya Soma Manadayannityadyastrisro Dvipadā Gāya-

Uşnik form1 with four seven-syllabic feet.

- c) Among Anuştubh class, Anuştubh², Virāj³ and Tripadā⁴ Triṣtubh. The last mentioned metre has been counted by Kātyāyana⁵ as belonging to the Anuştubh group, possibly because it consists of thirty-three syllables in all, but Pingala placed it in the Gāyatrī class perhaps on the basis of its three padas. 6
- d) In Brhatī class pure Brhatī, and Urdhabrhatī.
- e) In Panktih class, Pada Panktih, Akşara Panktih, 10 Virāja Panktih, 11 and Pathyā Panktih, 2 consisting of five eight-syllabic padas.
- f) In Tristubh the normal form consisting of four equal padas of eleven syllables.
- g) Jagatī¹³ however makes provision for two Sarvasama types one being normal, other is of Mahāpanktiḥ¹⁴ type consisting of six eight syllabic padas.
- h) The Atijagatī can be found in the stanzas consisting of fiftytwo syllables distributed equally among the four padas. 15

i) Sakvarī is the class among the long metres which has fiftysix syllables in seven eight-syllabic padas. 1

Ardhasama metres as its name signifies is of that kind which is divisible into two equal halves. This again has been formed in two different forms; one in which the alternative padas of the stanza concerned are identical in length, i.e, the metrical scheme of which is abab while the other is that where the first is equal to the fourth and second equates the third, i.e., the musical scheme is abba. Of these two types last mentioned one is not so frequent and popular in the Vedic literature as the former which has been transmitted to classicals.

- a) Satabrhatī² and its reversed form Viparītā³ and a particular acatalectic form of Triṣṭubh⁴ are the three forms that can be included among the first group. Jacobi⁵ endeavours to prove in his learned paper that this metre is the basis of corresponding metres belonging to the Vaitālīya class which are widely circulated in Pāli as well as Skt literature.
- b) Second group confirms three types and they are Vistāra Bīhatī⁶, Samsthārapankti⁷ and Vistāra Pankti.⁸

The Vişamas are those whose constituents are of unequal Length. Most of the metres in the Veda are of Vişama type. There are considerable number of Vişamapadā

metres which exceeds forty. We only, place here very few of them. They are for example, 'Gāyatrī Bhūrik' containing 8+10+7; Kakubhnyankuśirā having 11+12+4 padas.²

by the very designation Brhati Visama pada, we can easily infer that the Vedic prosodists were aware of the division of metres according to the length of constituent parts.

From the discussion made above it is clear that the Vedic poets were fully conscious of creating varieties of metres by employing feet of various length. Bhoja Rāja, the celebrated author of Śṛṅgāraprakāśa hinted at the same fact while dilating on the Pravandhas.⁴

Number of pādas in the metrical stanzas extant in the Vedas are the characteristic marks of some metres which sometimes point to the chronological sequence of the use of them. Ekapadā and Dvipadā are the metres which, so designated according to their constituent parts, form separate classes by themselves. Besides, we have stanzas of three pādas as in Gāyatrī⁸; Puroṣṇik⁷, and Kakubh⁸; of four

pādas as in Anustubh¹ and Tristubh; of five pādas as in Panktiha; of six padas as in Aşţārapanktiha and in Atyaşthia

of seven padas as in Dhrtis; of eight padas as in Atidhrtis which is the longest metre actually employed in the Raveda

hands developed to be a

containing seventysix syllables.

Gāvatrī stanza with four padas comes later chronologically and is practically absent in the Rgveda. The verse placed for illustration in Rkprātiśākhya is purely unvedic7 Even Halayudha fails to provide any corresponding illustration from the Rgveda.8 Nidana Sutra illustrates a verse from secular literature." On the contrary, this type of Gāvatrī can be found in the subsequent vedas. 10

Classical Skt, recommends for their syllabic metres only four padas. 11 Prākṛt metres however make provision for

the metres containing two padas¹, four padas², five padas³, six padas⁴ and eight padas⁵.

Number of syllables in a Pāda has been reckoned to be a metrical unit in the Rgvedic metre. Though the normally recognised pādas in the RgVedic manual are those which consist of eight syllables, ten syllables, eleven syllables and twelve syllables. There have been used in the Rgveda the four syllabic pādas, five syllabic, six syllabic, seven syllabic, nine syllabic, thirteen syllabic, fourteen syllabic, and sixteen syllabic. Prātišākhya however, recommends two more, i.e., fifteen and eighteen.

Last type of metre that the hybrid or mixed type can be found in the Rgveda which exists in group form. The groups consist either of three stanzas in a simple metres like Gāyatrī¹⁵, etc. or of the combination of two stanzas

^{14.} The illustrations recorded can be traced in Vāj. Sam. IV. 25. 15. syllabic pada can also be found in Sāmaveda Samhitā, 15, 2, 3, 8 and in Athv. VII. 14.

VII. 96. 4—6. is the unit of three Gāyatrī; — Anuşţubh Gāyatrau cānuşţubhonuşţubhmukhāstrca ityukte: 11 6 Rganukramanī. V. 28. 4—6; 82. 1—3; VIII. 3. 21—23; 9. 19—21; 63. 1—3; 7—9 etc.

composed of different mixed metres. The last mentioned feature has been traditionally designated as Pragathas.1 Strophes of five or seven verses, have been recognised by Arnold who traced them in somewhat later periods: the origin of Strophes consisting of seven stanzas has been associated with the conduct of sacrifice of Saptahotarah. Groups of ten, fifteen and twenty also can be found in the Rgvedic' collection.3 But most of the larger units however indicate a single Strophe building up the particular part in the same hymn.4 Except the solitary case of Anustubh, Pragathas in the eyes of the Skt authority are of doublet type.5 Whereas Arnold thinks all the lyric or Pragatha metres belong to triplet variety. Barhata Pragāthā of Maņdala VII, 96 consists of two stanzas (1-2). But as the said hymn contains six stanzas of which three is the triplet of Gayatri metre, in Arnold's enumeration, the remaining three is sure to form a triplet. The etymological meaning of the very word 'Pragatha' would speak in support of the use of doublet rather than triplet. The term 'Pragatha' in its technical sense means that kind of mantra which consists of two Reas and in its application

is treated as three through repeated utterance of it.1

The Strophic metres are generally made of the pādas of eight, eleven and twelve syllables, of which Pragāthās which have eleven syllables, are very rare. And some of the Pragāthās of this class are sometimes formed of the final verse of the hymn concerned and the initial verse of the next one. Tendency of grouping of verses composed of stanzas in different metres in a single unit can also be clearly noticed in Prākrta metres. Strophes in Pkt are composed of stanzas of varying number ranging from two to five in different metres.

In classical Skt, the groups consisting of stanzas varying from two to five are found to be used for the maintenance of the sense unit totally ignoring the metrical unit. Pkt Pragāthās on the other hand, like the Vedic prototypes contain both senses of syntactical and metrical arrangements. Besides, it can be noticed in the Vedic Pragāthās, the Gāyatrī pāda and Jāgatapāda have same prominent part to play and at the same time Bīhatī and Kakubh

made up of the said pādas are to be reckoned as more or less an important constituent. So Dohā and Gāthā play an important role in the formation of Strophe in Pkt metres. But Bṛhatī and its allied metres such as Satobṛhatī, Kakubh, Puroṣṇik, outside the Strophic arrangement can scarcely be found.²

The Bardic quality of versification is noticeable in grouping of versified stanzas with a view to synchronizing them with their musical element. This is the reason that makes the bardic qualities traceable in Pkt where the balled forms of poetry are more or less retained. The manuals of classical Skt do not retain these Pragāthā features obviously.

Incidentally it can be shown, that the absence of Pragatha chapter in the Vedic portion of the Pingala Chandah Sutra can be accounted to the fact that the classical literature makes experiment no counter specimen of it.

Satobihatī of Pingala is the variety of Bihatī consisting of three pādas whereas Satopanktih though contains the verse structure of Satobihatī of Pragāthā yet it lacks the very Strophic feature.

One of the interesting features that can be incidentally

shown in this connection that some of the hymns in the Rgvedic collection are found to be engraved with the name of the versifier who composed them. This type of verse generally contain the stanzas of identical metrical structure.

This peculiar technique has also been practised by the classical Mahākavis but more commonly by the Vernacular poets.²

Refrains³, one of the devise of the versification has been used in all parts of the Rgveda and also in the hymns mentioned above.⁴

This artifice is generally practised in melodramatic Skt kāvyas and in many other stotra type kāvyas.⁵

The Rgvedic hymns generally contain verses enshrined in different metres. But instances are not rare where a single metre predominates except the concluding one which

bears a character different from the rest 1 This very characteristics has been transmitted to classical kāvyas2 though Epics. 3

The discussion made above, mainly deals with metres employed in the Rgvedic collections. In it the metres have been represented in their very verse forms, in their different stanza forms, i.e., number of verses in a stanza peculiar to certain metres; in their group forms in which the stanzas are all Strophically or otherwise have been grouped and finally some characteristic features like Refrains of hymns etc. in which they are all collected. Needless to say, these features are the elements of the external structure of versification with which the Vedic manual on prosody is mainly concerned. On the whole, in their system little attention has been paid to 'metrical features' which is known as 'internal rhythm'. We shall now proceed to consider this internal rhythm which is less rigidly defined and at the same time has almost been ignored by the Vedic metricians belonging to early period.4 What they discovered in the penultimate syllable, is the characteristic mark that differentiate one metre from the other.5

But as the study of internal rhythm yeilds results of greater historical importance than the external ones, we shall have to consider it carefully, while we are going to build up the structure of the history of the Skt metrics pursuing its development chronologically as far as practicable.

The oriental scholars made an endeavour to find out the internal rhythm in the whole of the verse, while the traditional system recognised it only in the penultimate of the four principal metres which form the metrical units known as Pāda.

However, the actual result is that the findings of the oriental scholars happens to coincide almost with that of the traditional scholars having only difference that while the former treat them wholly, the latter treat them partially.

These oriental scholars, on the other hand, are in favour of implicit assumption that the pattern of the Vedic verses is cast on mainly in the quardrisyllabic mould, which has further been developed in the whole verse in the classical period.

By way of illustration we may refer to Gāyatrī pāda or the verses of eight syllables which are to be fallen into dimetre group and those of eleven and twelve syllables would be included into trimetre groups. Verses of ten syllables which are the constituent parts of the Dvipadā, Virāj and Virāţsthāna verses are to be reckoned as containing trimetre rhythm.²

Pādas or lines are the units in the Vedic metres. But the smallest unit is the number of syllables in a line, which is of primary concern like those of Indo Aryan and this seems to

Arnold—Vedic metre and its historical development. 1905.

be the first stage.1,

In some of these forms the rhythm of some portion of the latter half became definite. This phenomenon is clearly discernible in each of the four typed verses, i. e., Jagatī—12 syllabled verse, Triṣṭubh - eleven syllabled verse. Virāṭten syllabled verse and Gāyatrī—eight syllabled verse. This obviously seems to be the second stage of development. In the case of the eight syllabled verse, the rhythm of the single verse seems to be no longer indispensable and the rhythm of the second verse is accounted to be important to form the rhythm of a consistent whole.

For the verses of ten, eleven and twelve syllables, the rhythm of the single line is sufficient to sound the whole, but for the verse of eight syllable attention must be paid to two subsequent lines of uneven and even; and evidently this may be recommended as the last stage.

According to Winternitz, so far as rhythm is concerned only the last four or five syllables are fixed, while Arnold finds the movement of rhythmical development within the group of four syllables. Accordingly, the eleven, the twelve and ten syllabled pādas have been alluded to Trimetre group and the pādas of eight syllables to dimetre group.

cf. The remark of Arnold, Vedic metre, P. 226 "the presumed pre-Vedic forms of dimetre approximate to some extent to the nonquantitative verse of the Avesta, in as much as almost every possible rhythm is occasionally found".

Yadakşara parimāņam tacchandah I // 6. Sarvānukramaņī.

The metres in Gāthā is extremely elementary in character when the lines of the stanza concerned solely depends on the numbering of syllables in particular verses accompanied by a ceasura.

Gāthās are composed in measured syllables. The Vedic metre is one of the quantity, while the Gothic metre is accent.

⁻Avesta, ed. Kangra. Introduction XVIII. ff. 1962.

^{1.} Respective rhythm of the 8 and 12 syllables are

As for the dimetre verses, the rhythm varies according to the form of the stanza. Iambic rhythm is more common in fourfooted stanza whereas Trochaic rhythm in three footed ones.¹

These two original rhythm in dimetre verse laid the foundation stone of the Samānī and the Pramānī groups of classical rhythm. That is why Pingala had selected these two types as the very specimens to be dealt with primarily and to be counted among the Anuştubh group but not in the group of eight syllabled class of metre treated by him under the caption — Aṣṭākṣarapādabhedoktiḥ.2

Verses of eight syllables or dimetre verses can be divided into two parts each consisting of four syllables—the first of which would better be called as opening as has been named by Arnold³ as it opens the rhythm, the second part as cadence⁴ as it is the close of the musical phrase or the

measured movement.

The characteristic features of the dimetre verse are—the more or less free opening, indifferent initial and final and more fixed cadence. These very fours of the Vedic dimetre reminds us of the appropriation of the regulations for the verse structure of Anustubh in the manual of the Skt prosody "Ya caturthat" - implies comparative free movement of the first four syllables; "Na prathamātsnau" s -points out the indifferent initial "Pathya yugo ia"4 -marks the indifferent final of the eight syllabled pada.

Opening and re-opening: -

The three of the more frequent opening forms are U---, designated by Arnold⁵ as Normal, the Iambic U-Uand the Syncopated U U - The normal form as its name signifies, exists in the one third of the whole of the dimetre verses belonging almost to all periods.

Iambic openings predominates in early Anusubh but in the late period it is rarely found especially in Epic Anustubh7.

^{7.} Early Anuştubh in connection with Panktih and Mahāpanktih. Rv. I. 84. 6. Nakisthvadrathītaro Rv. I.84 2a.

Steady decrease in the use of the lambic form in the reopening is noticeable in the Anuştubh verses of the popular Rgveda. As that phenomenon is more or less fixed in the late Anuştubhs, consequently in the subsequent literatures, we find the appropriation of Pingala's regulation on the restricted use of the cretic (— U —) in the opening of the even pādas after the first syllable. Pingala noticed this fact when he ordinanced——"Dvitīyacaturthayoraśca".

Syncopated openings which is rare in early Anustubh has been found in abundance in later periods, especially in Gāyatrī stanza,³ the verse form of which, according to Western scholars,⁴ has surely appeared lately than Antstubh. On the contrary, our Vedic works always admit the priority of Gāyatrī⁵ to Anustubh, which according to them comple-

ments the deficiency of the pada by the fourth one which the former lacks. In the late period syncopated opening in the even verses occurs more than three times in comparison1 with the earlier use. It appears most commonly in some fragments of Epic Anustubhs2 while the Epic rhythm, i. e., U __ U predominates in longer hymns of Anusubh metres.3 These forms are at the root what gradually developed in the Anustubhs found in the Epics.

The consecutive shorts in the second and the third is very rare in the Vedic verse, hence called irregular.4 Pingala has noticed this fact too. That is why it has been codified-"Na prathamāt Snau"5. As for cadence, only one form predominates i. e., Iambic form U - U - except in Trochaic Gāyatrī and in the uneven pādas of Epic Anustubh.

Following characteristics of the dimetre verse can be noted below :-

- 1. Trochaic rhythm-is more common in Trochaic Gavatrī but rare in the semi cadence of the Epic Anustubh.
- 2. Iambic Cadence-common form of both cadence

^{1.} Vide, Arnold Vedic metre, P. 151.

and the semi cadence in the early Anuştubh and in other dimetres of the archaic period. But it is fairly common in the cadence of Trochaic Gāyatrī. In later period, Iambic cadence became fixed in the even pādas, leaving the places to the forms U — — and — — — U.

3. Next to lambic form, most common in the cadence in order of frequency are U — U and — —U². In the late Rgvedic age these semi pathyā forms i. e., occupied the semi cadence and in the post Rgvedic age, it shifted to the cadence and the classical composition shows a varied type of forms, the most common of which are the pathyā, Vipulā, U—U U and sometimes only lambic form, U—, the short seventh,

Finally it can be shown that Iambic cadence in both pādas is partly retained in the rhythm of the classical literature. That is why the Vedic Sage Saitava recognised the Seventh short of the both pāda, while, Pingala makes provision for it in that of the even one.³

The Iambic Cadence in the even padas and the syncopated in that of the odd padas can be marked as the very basis of the classical rhythm.

The beginning of this new rhythmical tendency is to be sought in the metres of Panktih and Mahapanktih. It

Semi pathyā —Pathyā rhythm U - - U in semi Cadence, whose rhythm of the cadence is U—U i. e., Iambic, hence the form placed above—can be termed as semi Pathyā form.

is in these metres, the differentiation of odd and even padas was first attempted. In archaic period these metres seemed to have been hardly known. Therefore they will be counted as the bridge to fill up the gap between the earlier and the later parts of the Rgveda.

Finally, it can be added, that the very syllabic arrangement and the rhythm of the Anustubh verse alone point at the fact that the Vedic versifiers had a definite idea of what is known as Sarvasama and Ardhasama vitta we already discussed.¹

There are 24000 trimetre verses being two-thirds of the contents of the entire Rgveda. This group comprises, Virāja, Tristubh and Jāgata pādas.

This type of verse is cast on quadrisyllabic mould and Tristubh being taken as standard norm, the eleven syllables have been set by Oldenberg² in order of four, three and four supported by Arnold³ and of four, four and three by Randle and⁴ others. Like dimetre verse, the first and the last being respectively designated as opening and Cadence, the middle has been termed as brake as it breaks the flow of the rhythm.

In addition to them, Caesura has been conceived of by Arnold which act as a brake on the rhythm of the opening and on the break.

Etymologically the term 'Tristubh' itself signifies three

fixed metrical rhythm probably in the close of the feet.1

As a shortest specimen of trimetre verse, with Virāja pāda, we may introduce first, the decasyllabic type of verses which contain less syllable than the scheduled number. In trimetre group according to their respective rhythm, there exist two types of decasyllables, to one of which alluded the Virāţsthāna² verse which with slight modification predominantly are found in Gautamī³ verse and the other to which belong the hymns of Pentad⁴ and Bhārgavī verses.

All the types except the Bhārgavi verse, contain mostly the trimetre rhythm of Tristubh and Bhārgavī hymn⁵ sticks to that of Jagatī

But it should be borne in mind, that occasionally, they are found in reversed type of rhythm, i. e, Bhārgavī in Triṣṭubh and the remaining three in Jagatī.

Virāţsthāna and Pentad verses are chiefly found with Trisţubh hymns and sometimes believed to be alluded to the class of Trisţubh. This assumption runs counter to the analysis of the fact enshrined in the manual⁶ as well as in

^{1.} According to some "Stubh" in the compound Anustubh, tristubh means, "stopping, pausing". "The metre requiring regular stoppage or pauses"——M. W. P. 1259. cf. Max Muller P. XCVI "I look upon tristubh as meaning originally Tripudium and I explain its name three steps by the last three syllables V—V which form the characteristic feature of that metre. cf. Weber, I. S. VIII. P. 51. Wortlich wohl die mit drei

stubh, absatzen versehene, etwa, weil bei der Lange ihrer pada am Ende eines Jedem derselben ein Absatz der Stimme notig ist, wo bei den der letzte Absatz am schlusse des verses nicht mit in Rechnung Kam, nur die drei innerhalb des verses befindilichen del gerechnet worden.

practical application.1

Without going into its every minute details, we can show that the decasyllabic verses bear all the characteristics that can distinguish them as belonging to more or less archaic period. According to extant theories it can be found that Virāja as a class of tensyllabic metre is practically extinct in comparatively late period, while it has had wide recommendation in Samhitās and Brāhmáņas. Needless to say that Virāja as an independent metre has no function even in the Atharvaveda; even pure Pankti having five syllabic pāda is also absent as not being found in Vihadanukramaņī.

Besides, there are catalectic Jagatī,4 extended Tristubh,5

 The origin of the pentad through splitting up the tristubh verse can be established by the use of three pentads and a tristubh appear in RV. IV. 10. agne tam adyā / aśvam na stomāḥ Kratum na bhadram //

hṛdispṛśam ṛdhiāmā ta ohaiḥ, All of the verses except the 21st of the hymn RV II. 14 are in Virātsthāna metre. And the 21st is in Triṣṭubh. c. f. Sāyaṇa Bhāṣya:— "Virāṭsthāna triṣṭubh". The definition of it— "Virājau navaka traiṣṭubhaṁśca".

2. R.V. 10. 130. 4, 5. In the 10th mandala of the Rgveda among the seven metres, Virāja has been inserted and consequently as a metre. But in later period, it lost its significance as a metre and panktih took the place of it. This can be easily discerned in the Atharvaveda, Ait. Ār, where the very verse has been going to be explained, Panktih has been installed in place of Virāj.

hyper syllabics. 1 and hybrid verses. 2

Caesura is the most essential feature in all the trimetre verses and in Arnold's findings there are only three verses in the whole of the Rgveda which lacks Caesura of any kind.

Generally, the position of Caesura is either late⁴ or early,⁵ i.e., after 4th or 5th syllable.

Besides these, there is weak Caesura making hit after the 3rd syllable and sometimes dividing two words. Both these are characteristics of archaic period and their occurrences are very limited.

Lastly, we may refer to secondary Caesura which takes place after the 8th syllable and supposed to be grown out with the combination of four syllabic pada with the dimetre verses.

In the case of early Caesura, most common setting is long third with short fifth⁸ and in that of late is short third with

long fifth. Accordingly we have two types of openings U_Us with early Caesura and U-U - with late ones. Perhaps these two groups gave rise to two major groups - Sālinī - Vātormī and Indravajrā.

So it can be seen from the given features that the rhythm fluctuates generally with the quality of the third and the fifth. The favour has been shown in almost every mandala to the second group, i. e., short third and long fifth with late Caesura and this is leading towards an almost rigid scheme which may be represented as U - U - UU - U - C. The designation has been given by the classical manual, after the name of God, which has been accidentally stitched up in a stanza embracing mostly the same rhythm. And it can be assumed unhesitatingly that after this, the classical prosodists have been encouraged to apply the method in their definition, i.e., to stitch the name of metre in the definition.

Among them the long third generally corresponds to the indifferent fifth^s; and the short fifth with it is generally the occurrence of the comparatively archaic group.

Historically, 5th short is more normal than the long. 5th in earlier mandalas. In RV. IV. 2, there are fifty cases of short and thirty of long in eighty padas and RV, VII, 2 yeilds the same results. But in the later period, the figure of the short fifth has been decreased considerably and in pre-classic and classic-age the long fifth predominates. 4

Fourth syllable is long in 75% before the early Caesura and before a late one it comprises 96% cases. The Indra-

vajrā group predominates through the ages.

Irregular is the form which has consecutive short syllables in the 2nd and 3rd places. And the form <u>U</u> UUU embracing double irregularity makes its appearance very restricted.¹

Rhythm of the brake is partly affected by Caesura and the Rgvedic verses place two normal forms UU — and —UU comprising two major groups as has been shown before. These rhythm found in the Rgveda have been exerting its influence on the classical rhythm so much so that this type of rhythm are seen abundantly in classical metres² also. Subnormal form after an early Caesura — U —³ is much more common than the normal form — UU and seems to rank as regular in the cretic and popular period. This group happens to be as much infrequent being one seventh of the normal namely Vātormī group i.e., UU — but subsequently this subnormal group namely the Sālinī group i.e., — U — came to be very frequent and consequently normalised.

Indravajrā = U — U— — UU — UU — — Yation Indriya Rasa = Kudmaladantī = — UU — UU — — Yation Indriya Rasa = 5 — 6 =

^{1.} RV. III. 29. 14c. na ni misati surano dive—dive. Like those of dimetre verse. Almost in all classical languages, the use of consecutive shorts are avoided in the composition. In Greek we see that it embraces all kinds of artificiality to get rid of the form UUU cf. F. de saussre'a montre' (dans en article des Melanges Grand) alors que le Grec a recourse a toute sorte d'artifice pour eviter UUU. Le latin offre une tandance semblable (V. Juret—Phonetique Latin—P. 270) Op. Cit. Ref. 130.Ch.II. Sec. I.

VātormI=— — UU— —U— —P. Ch. Sūtra VI. 21.
 Dodhaka=—UU —UU—UU— —P.Ch. Sūtra VI. 19.
 Classical manual makes provision for the pause after 4th in case of Vātormī and in case of Dodhakam. Halāyudha noted down the same after 4th.

Next to them are UUU¹ and -UU² the subnormal forms before early Caesura and U UU after a late Caesura.

Occasional forms U-U, U-U, -U are more archaic except the second which appears frequently in strophic period.

Taking each case separately it can be found long 7th after an early Caesura appears more than usual³ and short 7th after a late Caesura made occurrences about one third as frequent in every period. Short 6th like the long 4th is the common figure. Consequently we have two major groups according to the position of the relative quantity of the syllables. Under the first we can have early Caesura with long third, short fifth and long seventh and under the second—short third, long fifth and short seventh. Indifferent initial occurs for the second group and more or less is fixed the long initial in the first group. In other words, we find Trochaic preference for the first and lambic preference for the second.

This is the last group that predominates through the ages.

And from these two emerged the third major group which embraces the long third from the first, long fifth from the second and long seventh again from the first together with its division through the early Caesura. This is the Sālinī group. First one is Vātormī, second one is Indravajrā and in each cases short sixth and the long forth are the common.

Cadence¹ has been provided with more fixed rhythm, therefore it is not subject to elasticity. Inspite of its rigidity in form, the short eighth is not uncommon in the Vāmadeva and in the normal period and this forms a separate category by itself in the Vasiṣṭha hymn.² The short 10th is not very common and is about as half as common as short eighth.

Long ninth is fairly common in Pentad hymns. All these irregularities in the Cadence tend to indicate the archaism of the verses.

Sāma Gānas took their origin from the Rcas which are termed as Yoni of the former. Only a very few verses in the whole collections of the Sāma may be called really Sāman's own verses.

Most of the verses found in the Sāma Veda are composed in Gāyatrī and in Pragāthās which are formed of the Gāyatrī and Jāgata pādas, containing both of them short syllables in the penultimate. The metres used in it posses the musical quality because the very terms Gāyatrī and Pragāthā are formed of the word Gai— to sing. 4

In the index of the metres of the Samaveda prepared in

Upanidānam Sūtram, the largest recorded metres are of Atyasti types containing sixty eight syllables. The very pāda arrangement of Atyasti remind us of the form of Satobrhatī which are mainly found in strophic and lyric hymns.

In the Sāma Veda the mantras have been extracted from the Rgveda and have been set into music. The Yajurveda on the other hand, though has been traditionally believed as containing only prose formulae, consists of both verses and the prose formulae. And it has been found in Taittirīya and Vājasaneyī Samhitā there are good many portions, leaving aside those that have been borrowed from the Rgveda, which may have claimed to be metrical composition.

The celebrated commentators of Pingala Ch. Sütra, like Yādavaprakāsa and Bhāskarācārya have endeavoured to include certain Mantras of the Yajus as case of the metres. 5

Anukramani of Sukla Yajurveda while preparing the index of metres has shown the features of the metres, some

of common and the rest of rare types.

In the Yajus we have the references of the four footed Gāyatrī¹ as well as third group of metre beginning from Kṛṭi. Uvaṭa referred to these as to be traced in the Subheṣaja or in the Atharvaṇas. Actually, however we cannot find all the seven longest metres of the Kṛṭi group in the Atharvaṇas. The longest two cannot be traced there. In the Yajurveda on the other hand, we have all the seven metres of the Kṛṭi group² and even that of which there is no consideration in the traditional Vedic manual.³

The metres longer than those which contain 104 syllables have been recognised as Daudaka in the classical manual. As a matter of fact, so far as the number of syllables are concerned Daudaka have been originated from these largest metres but as regards rhythm, they are matra metres as we shall see subsequently.

In its physical feature as well as internal rhythm, verses of the Atharvaveda are taken to be as posterior to that of the Rgveda.4

So far as external form is concerned the Atharvaveda made provision for enlarged as well as advanced treatment of metres than that in the Rgveda. The metres shorter than Gayatri class can be traced in the Atharvaveda, though the

Brhadanukramani describes that the class of chandas begins from the Gayatri.1

It would not be out of place here to refer to Uvața who made mention of the metres of the Kṛti class in course of placing illustrative verses which he could find only Subheṣaja which is synonimous with the word Atharvaṇa, which is only the alias of the Atharvaveda.²

The available verses of the Atharvaveda include all the metres belonging to the Krti group save the last two long metres Abhikrti and Utkrti.

So far as rhythm is concerned, Bloomfield⁵ is perhaps the only scholar in this line to advocate the theory of the parallel development of the Rgvedic and the Atharvanic verses though they differ in theme, namely, while the former contain adoration to a given deity the latter consists of the charms directed to the attainment of some specific sub-

ject. Moreover, the Atharvanic Anustubh permits not only the Rgvedic and the Epic norms of the late centuries, but also many other different forms counterpart to the non-quantitative Avestan forms. These different types of Anustubh forms comprising both hieratic and Epic, indicate the archaicness of the Atharvanic verses than those of the Rgveda.

But some inaccuracy has been proved to exist in his scholarly pursuit and it has been found by Arnold and others that Epic ending U-- U in the old verses is a later development, rare in the archaic Rgveda, much common in the Atharvaveda and has been fully established in the Epic.

This can be shown in case of Trimetre groups in the Atharvavedic verses, where the Trimetre rhythm shows more lateness, than those of the Rgveda proper and lyric period.²

Moreover, verses of eleven and twelve syllables are sometimes found inextricably confused in the same stanza. These cannot be called as contaminated but to be termed as irregular and defective.² For Bloomfield it is difficult to determine whether the passage is to be condensed in prose or doggered metres.³

So far as rhythm is concerned, there are Trimetre verses externally contaminated, chief characteristic of which is the existence of Tristubh and Gäyatrī verses in the same stanza.

occasionally shortening before the Caesura represents to be more free and B differs from the previous one in greater rigidity and C is marked by the increasing favour for the long 5th which is sure the mark for lateness.

^{1.} While making a comparative chart with the twelve syllabic verses of lyric, Rgveda proper and Atharvaveda we can see the following:—

c. $\underline{U} - \underline{U} - \underline{U} \underline{U} \underline{U} - \underline{U} - \underline{U} - \underline{U}$ lyrics show

^{2.} Vide, Whitney, Atharvaveda. I. Introduction CXXUI.

Mr. Jourdian thinks it is either prose degenerated from verse or the prose elevating into prose. Arnold recommends more the former than the latter. JAOS. Vol.XXII.P. 318.

These are found mainly in the later Atharvaveda and later literature down to the Epic.

However, this can be seen that the Atharvaveda permits varieties of norms but about their chronological sequences nothing definite can be said at present.

In the Aitareya Brāhmaņa, there are considerable number of gathas apart from the Revedic citations. In the narrative of Sunahshepa (VII), there are twenty-nine slokas and their metrical forms are very interesting as they contain both archaic and classical forms. Out of the fifty eight and a half verses there are only fifteen cases of pathya ending U- -U in the odd padas, - - - U: twelve times, UUU U: four times, - UU U: six times, the form ending in - U - U occurs six times. -- U- three times, and eight times occurs the form U---U-U U. Last three forms are wholly alien to classical versifications. It can be found di - iambic ending is 15.5% whereas the forbidden forms comprise nearly 28%,1 popularly known as "Bad Vipulas". But in the account of the consecration of kings,2 the increasing number of the percentage of the pathyā form is remarkable. It occurs fifteen times out of twenty-four against fifteen out of fiftyeight in the Sunahsepha legend. But of the remaining nine forms, eight are not in classical Skt.

Finally it can be said, that the rhythm of the Anuştubh clearly shows that they are posterior to that of Rgveda but anterior to that of the metrical composition of the Katha, Kena and Isa as has been exhibited by Oldenberg.8

There are four Tristubh stanzas in the Yajñagāthās. Of these sixteen Tristubh lines two are irregular so far as sylla-

In the account of Morton's statistics, we have the following figure:

 16/10, 7, 4, 6, 2, 4, 9. The popularity of Bad Vipuläs — These are D, I maj and I min. This tendency is clearly discerned in Aitareya Brāhmaņa — Indo Ir. Journal. IV. Pp. 27.

^{2.} Ait. Br. VII. — 21-23.

^{3.} c.f. Oldenberg, Alteindische Äkhyāyana, ZDMG. XXXVII,66.

ble is concerned: the first having thirteen syllables and the second having ten both with trochaic ending. The lines are not uniform in rhythm, even any two lines of any stanza do not have identical pādas. Three pādas in one case are the same in the last seven syllables.

Oldenberg had shown in his statistical findings the rhythmical development of brake and by this he tried to establish the fact that the Tristubh in the metrical portions of the Brāhmaņas such as Aitareya, Satapatha and Katha Upanişad are older than those of Pāli texts,² but younger than those of the Rgvedas.

Besides them, there are four other types of stanzas. One of them has 12-12-10-13 syllables. Most of them are irregular in rhythm. These verses are decidedly older than those of Brhaddevatā and Rgvidhāna. In the Kauśītakī Brāhmana on the other hand, we met with a couple of ślokas, which are of archaic types than the śloka forms of Aitareya Brāhmana.

In the last phases of the Vedic age, we find Grhyasūtras which contain same metrical portions meant for recitations. In these verses, fortunately we find certain forms—a bridge that makes up the gap between the Vedic and the Buddhistic verseforms on the one hand, the epic verseform on the other.

Most of the verses are enshrined in Anustubh stanzas. By the study of the metrical forms of Anustubhs, we can have a clear idea about the development of internal rhythm, that come to be introduced subsequently in the Epic and Post Epic Skt. literature. Perhaps Anustubh is the only metre that gives abundant scope of studies of its development through different phases in ancient literatures belonging to different periods of history.

Archaic Vedic Anustubhs 2 maintain Iambic cadence in

^{1.} Vide. chart, Pp.61. Ibid, Idem.

both the pādas. But in later parts of the Vedas, we find in the Anustubh verses not only the departs from the old usage in the odd pādas but there appears a direct contrary course—the adoptation of the antispast (U — U). Comparison of the Gihya songs appeared in the RV. X..85 with the rites preserved in Anustubh in Sānkhyāyana Gihyasūtra 1:19;5;6 gives us the fact that the latter is later than the latest Vedic poetry and coincides rather with the transition period and lies between the late Vedic and the later Buddhistic and the Epic form.

It will not be out of the place here to quote some references bearing the rhythm of the transition period appeared in other Grhya songs. 1

Again Agnae samidham aharsham tayatyasu Agne Vardhasya in Nalopākhyāna of the Mahābhārata covers approximately 5/6 of all the cases, appears in S. Sū. covering about three quarters of the whole book, having twice the ending U —UU which is the normal form in the Rgveda.¹

If we compare metrical forms allegedly belonging to Dharmasūtra in different citations with the verse forms found in Grhya sūtras, we will be convinced of the fact that from the standpoint of metrical compositions, the Grhyasūtras appear to be posterior to the former. Apart from these, the Apastamba Dharma Sūtra contains several isolated verses, most of which retained classical rhythm.²

Some of these are defective in metre having nine syllable in one Anuştubh pāda. Besides these, there are some verses in Tristubh metres with the Vedic rhythm along with one in the classical rhythm. Metrical rhythm seemed to be found in some prose passages and sūtras quoted in the Grhya and Dharma sūtras. But pure classical rhythm is clearly discerned in the metrical aphorisms of Gautama Dharma Sūtras.

In Mānava Grhyasūtra, some prose passages appear to contain metrical rhythm like Vrttagandhī metre. This very

portion being originated from the Brāhmaņa portion of the Maitrāyaṇī Samhitā, exhibits śloka rhythm.¹

It becomes therefore obvious, that the frequent use of the classical rhythm in sūtra literature represents the period of transition in the process of the full-fledged development of regular Epic rhythm.

Atharvaveda parisistha² is the next text of our concern. Like other Vedic works there lies the uncertainty in fixation of the date of this work due to the heterogenous character of the subject that the text contains. General considerations are adequate to refer them to the time at the end of the Vedic period proper when the Vedic tradition was becoming more and more faint and the verses were transformed into the form of classical.

Verses of the parisistha (XXXVII) bear the character of both the sub-Vedic and the Vedic forms. On the other hand in (XXIV) twenty and half verses go on with the regularity and the verses 2.5—3.2 and 5.1—6.4 are written in regular Upajātis and Vasantatilakam.

In parisis ha XLIX the proportion of the irregularity somewhat less in number. In the parisis ha Grahayuddha, LI the occurrence of Vamsastha and other ornate metres and the number of irregular verses in LII on the decreasing line prove the relative lateness of the age. In the chapter LII again on the grahas of 164 half verses only eighteen are irregular. The verse in LV. 6.4 conforms to the regular Āryā pattern.³

In the period, preceding the Atharvaveda parisistha, the Bihaddevatā can be placed. Because, in Bihaddevatā irregular verses run with the irregular slokas loosely called Anuştubhs, whereas in the Atharvaveda parisisthas regularity in verses is more frequent. Of all the remnants of the

Vedic literature the Brhaddevatā has the great merit of being preserved in its authenticated form as it has been checked by the quotations made in the Sarvānukramanī.

As for the Anuştubhs of Brhaddevatā it can be said that the forms exhibit later characteristics than that of the Ahuştubhs of the popular Rgveda. Some portions i.e., 380 halves allow more archaic forms than as allowed in classical age. The śloka specimens of Brhaddevatā represent a genuine stage of the historical development of śloka if one compares them with fifty-eight halves in the Epic narrative in Aitareya Brāhmaņa.

In the treatment of Tristubs, one will find that out of 4.2 verses there occurs only one whose all the padas are alike in metre. The verse 130 of ch. VIII is of six padas with 11 syllables in each, of which again the 1st and the 6th are Indravajrā and the 4th and the 5th are Upendravajrā, Of the twenty four Jagatīs twelve have the Jagatī ending U-U U whereas ten have in U-U and two in UU—and - U - respectively showing archaic norms not followed in the classical literature. We will close our survey of the

Brahmanical literature after sparing a few lines on the metrical specimens of the Anuvākānukramaņī, Rgvidhāna and Rg Prātišākhya—all of which are metrical compositions and appear in an age posterior to Brhaddevatā. There are fortysix stanzas and a verse in Anuvākānukramaṇī, of which fifteen verses in the introductory portions are of somewhat regular type. Of the remaining 31 stanzas 17 were in Tristubh rhythm and 14 in Anustubh.

The earliest run of the classical slokas can be found in² the Rgprātisākhya. The order of the popularity of the forms of Bad Vipulās are Di-iambic, I maj. and I min. This seriality is the marked characteristic of the Rgveda verses. The relative pattern of the Anustubhs are 316. 32. 25. 7. 16. 10. 14. 33.

In rough estimation, the metrical specimens appeared in the composition of the Rgvidhāna show more affinity with those of Bīhaddevatā as both of them belong to Saunaka by tradition. These exhibit clear traces of the Vedic forms similar to those as has been noted by the editor of Bīhaddevatā. Archaicness in rhythm can be noticed in the following verses 1.1.1;5.6;1.2.1.;3,42.6-7. In most of the stanzas there are blend of the rhythm of Indravajrā and Sālinī group.

That Anuştubhs in Rgvidhānam are essentially of a later type than those of Grhyasūtra, can be estimated by the fact that the posterior pāda of each hemistich ends with

Regularity of the metrical rhythm presupposes the fact that the text had undergone some revision.

"U-UU" whereas the closing part of the prior pada represents the feature "U-U" in 1237 cases out of possible figure 1472 with a few exceptions. The remainings show a much greater variety of forms than is possible in classical one.

The U-U-U which is absent in classical age, appears in 13 cases in Rgvidhānam but in Grhyasūtras they are almost regular. Out of the eight stanzas four are Tristubh with Jagatī final U-U—. There is also 12 syllabled Tristubh with Tristubh final. Besides, along with some hypersyllabic Anustubhs consisting of nine or ten syllables, there are two Vasantatilakam¹ and two Indravajrās.²

Though the Upanisads form a part of the Brāhmanas, they grow in seclusion being detached from the influence of the other liturgical works discussed before.

These Upanişads, a mixture of half poetical, half philosophical fancies and dialogues, dilate more on the speculative side being clothed in the language of poetry. Their earnest longing for the true knowledge leading to disregard for all pleasures find poetical expression in the metrical passages where we find fervent lyrical appeal. These are discerned more in the Upanişads of the transition period the language of which is more akin to classics.

The Upanisads on internal evidences chronologically can be set into three groups. The oldest group comprises Brhadāranyaka, Chāndogya, Taittirīya, Aitareya and Kauśītakī exhibiting Brāhmanical prosaic style. Transition period is headed by Kena which is the earliest of the metrical Upanisads such as Kāṭhaka, Iśa, Śvetāśvetara, Mundaka. The style exhibited in this group is much attractive from the literary

¹³ CC-0. Jangamwadi Math Collection. Digitized by eGangotri

point of view and it acquires a peculiar charm for their liveliness; enthusiasm rises often to the level of eloquence approaching more or less to the classical type. The last group belongs to the later age.

Following characteristics can be noticed in the metrical passages of the Upanişads exhibiting poetical style.

- 1. Best achievements of the old dispension.1
- 2. Representation of the transition to the new.
- 3. Absence of such a developed form where the four times repeated rhythm of the Tristubhs had been cared for.
- 4. Rhythms are in many places in accordance with the theme and the sentiments of the passage.
- 5. Metres sometimes change with the change of the topics.
- 6. The phenomenon of equivalence, a devise applied in the formation of new classical metres out of the main metres.
- 7. Gradual ascendency of Śālinī over Vātormī. The former, which was only half as numerous as the latter in the Rgveda, is in the Upaniṣads five times as much. This is surely a mark of the advanced stage of Upaniṣadic poetry in comparison with the Rgvedic verses.

As the form of transition period we have twelve syllabled²

Tristubh, ascendency of the Sālinī over the Vātormī,¹ greater freedom in the disposition of the Caesura noticeable as it passes from the Katha to Sveta. In general, all the verse specimens, except two complete stanzas and some complete lines bearing the identical rhythm² and the classical rhythm respectively, bear the rhythm of the transition period.

Poetic mood is more expressive in onomatopoeic passages in which the prosodical schemes have major part to play. The solemnity of the theme is more apparent in the use of Śālinī and is sometimes elevated to a point where the Vaiśvadevī is the only figure. Most interesting to note in this connection, in both these metres the heavy syllables predominate.

Onomatopoeic trends where the sounds echo the senses more, are clearly discerned in the Kāṭhaka passages 1.23, where the sound echoes not only the senses but also the rhythm. The solemnity of the Death's speech are more apparent with slow ascendency of Śālinī over Vātormī and advancing towards the Vaiśvadevī rhythm.

The first two and the final chapters of the Svetāsvetara, contain prosodical specimens with varied and modulated rhythm concordant to the requirements of the moment.

The famous Yoga passage of Sve. II. 8—15 is no less notable for its metrical perfection where the different types of rhythms slow down from pāda to pāda until it ends in the slow full volumed Śālinī of the last pāda.

So is Naciketa's violent exclamation in answer—in the Vaisvadevi opening—(26) "Svobhāvā'martyasya yadanto-

kaitat". One will feel the firmness of mind in the dialogue "Jīviṣyāmo yāvadiśiṣyasi tvam varastu me varanīyah sa eva"—which Mr. Ayer, describes as "a magnificent model of the dramatic verse conversation of the stately order".

Change of the metre is another effective devise to indicate sometimes the change of topics. In Death's speech there has been presented a picture of wonderful change of metre from Tristubh to Anustubh. "Om" at the end of Tristubh series, suddenly declares "Brahma" in Anustubh, then continue a series of Tristubh stanzas; the climax is reached and the emotion is broken in the hybrid form of the Anustubh and Jagati.

The phenomenon of equivalence, whereby two shorts are treated as one long is to be applied in all the early post Vedic literature of which we will make a fair discussion. This principle is applied in both Anuştubh and Triştubh.4

Upanişadic poetry—4th Oriental Conference, 1928.
 P. G. Ayer. P. 29

In this connection one should borne in mind the appropriate words with their syllabic arrangement, or Sabdaguna samādhi and Udārtā have been conceived by the Indian poeticists as constituting a graded procession of short and long vowels, pointing out to the role of metres in striving maximum effect on the ear to create artistic beauty.

UU-U-UU-U=Upajāti. In its present form it is Mahendravajrā.

As for Moric metres they are almost non-existant in the Upanisads. There is neither Āryā nor any Vaitālīya, nor any of Mātrāsamakam type. But some of the modern scholars find in some Upanisadic verses the rhythm of Āryā and try to put them into the form of that metre. They declare them to be the arch type of the said metre but their forced applications are obviously failure in its aim. Sometime some scholars make capital of same verses to theorise their speculation. But the verses they put for example belong to the Upanisad which seems to be composed in the 4th cent AD.

The Anuştubhs of the Upanişads can be categorised into two groups—archaic exhibiting more Vedic character and less archaic appear to be classical.³

manasā manthānabhūtena // (Br. Bind. Up. 20)

Bhāskara follows this closely.

Rāmāyanam claimed to be the earliest Kāvya as far as śloka metre
is concerned. It is the earliest Kāvya which lowers down the
Vipula figure, expels out especially the D Vipula. Obviously,

- Archaic AB, Sunahsepha episode -1. P M T I min X π I mai D 16 10 . 7 4 6 2 9 (Last three are called Bad Vipulas)
- 2. Br. Up. Chs. 1-5-6= 7. 7. 3. 3. 1. 1. 0. 1. 9.

 Br. 3 9-- = 4. 3. 0. 1. 1, 1. 2. 2.

 Kath. U I = 2. 1. 1. 1. 7......

 Kath. U II-IV = 21. 5. 4. 0. 0. 2. 0. 2.

 Kath. III = purely classical 26. 1. . . 0. 0. 0. 0. 0.

 Kath. V-VI=27. 2. 3. 1. 0. 0. 0. 3.

 Pras. = 7. 3. 2. 0. 0. 0. 4.

Prasna contains proportionately high Diiambus figure. On the contrary next group shows favour to Bad Vipulas and leans towards the Pathya and the others. This group comprises the following Upanisads:—

Maudu U-14. 1. 1. 0. 0. 0. 1. 0.

Maitr. -IV-V=11. 0. 1. 0. 0. 0. 0. 0.

Maitr. VI — =61. 2. 2. 2. 4. 0. 1. 0.

Maitr. VII =12. 0. 0. 2. 0. 0. 0. 0.

and Paingala =41. 0. 0. 1. 0. 0. 0. 0.

In the premier group and in the first two of the later group, the order of the popularity D, I maj., I min. This agrees with the Rgveda and the Rk Prātišākhya¹ whereas

the 2nd group of Upanişads would contain less number of D. Vipulas.

^{1.} Pathyā Molossus (M), Choriambus (X), Paeon (II), Trochee (T) Ionicus a minore (I min), Ionicus a majore (I maj), Diiambus (D). Among them — Last three figures I min, I maj and D are the bad Vipulas and consequently archaic. Mandukya Upanişad probably also belongs to the later period Sankara, who quotes the 12 Upanişads enumerated as sacred and authoritative texts in his commentary on the Brahmasūtras, mentions neither Maitrāyanīya nor Mandukya Upanişad (Winternitz, Vol. I. Part I. P. 208). Maitrāyanīya Ūpanişad is in language and style nearer to Cl. Skt. Lit. than to the Veda and decidedly post-Buddhist. Ibid. Idem. P.230.

Katha mentions the order D, I min.; I maj, which occurs also in Brhaddevatā. Both these are the marks of the Vedic influence.

The Anustubhs of the Isa is more akin to the archaic śloka in that it contains a number of Dijambic. It sometimes shows continuous lambic rhythm.2 Sometimes the pattern agrees closely with that of Br. Ar. Up (Kanva) 3. 9. 28 = (Mādhyandina. 3. 9. 38 ff). Though the Tristubhs show archaicness in preservation of the Caesura after 4th and 5th having³ short syllables at the 6th and 7th, there are not less than 7 verses out of 15 exactly coforming to the classical pattern of an Upajāti. Finally, we can close our discussion by mentioning the cases of refrains which sometimes decorate the body of the poetry as well as heighten the lyrical mood.4

c. f. 33. 14. 10 = Rk. Prātiśākhya.

In Vedic Anustubhs however the order of popularity is D which is normal, II, I maj, X, P. I min, M, T.

II. PALI WORKS

Canonical as well as non-canonical literature of the Buddhist have been enshrined in Pali language, which according to Bhandarkar approaches more to Skt than any other vernacular language. The vast literature of the Buddhist represent three distinct stages:— In the early stage most of the canonical literature have been preserved in prose interspersed with the verses. The number of verses in earlier 'Piṭaka' is very scanty and it increases in the successive ones. The compilation of this earliest 'Piṭaka, began according to tradition. immediately after the death of Buddha.²

A very few stanzas which are found in the Vinaya Piṭaka, the earliest of all, are composed in syllabic metre. Available stanzas are enshrined in Trisṭubh rhythm of Upajāti type and of the Vedic type. In the first case, there are verses where the process of substitution of a long for two shorts appear to be in vouge.

The longest metre that we find in the solitary verse is Jagatī with the free archaic Vedic rhythm. Anuştubh patterns however bear more tendency of leaning on the Epic śloka than to those of the Vedic Anuştubhs. But instances are not rare where there are Iambic rhythm in odd pādas which are alien to the Epics.

Simon's scholarly dissertation on Pali sloka had shown

that the rhythm of the Pali Anuştubh¹ in the Jātakas which is supposed to be later than that of the Pitakas, retains Epic rhythm in their odd pāda, but in respect of the stability of the syllabic occurrence, resembles more closely to the Vedic rhythm than to the Epic one. The analytical table of the metrical patterns of the stanzas of the Ekanipāta, Catukkanipāta and Chakkanipāta had shown that more or less they conform to the classical regularity. The number of stanzas other than Anuştubh are very scanty in Vinaya but increase very largely in these nipātas.

Of the three, the metres of Ekanipāta reflects more archaic character than the remaining two. Out of 88 stanzas of the Ekanipāta² 36 are pure Anuştubhs, 16 Epic Anuştubhs³ and 36 irregular Epic Anuştubhs.⁴

Of others, there are 7 Mahāpankti, 15 Tristubh and 3 Jagatī Among the Jagatī rhythm we have traces of the Tris-

- 3. U U conforms 75%. Bad Vipulās UU and UU are totally absent.
- 4. Epic nature found in one part. This type of specimen is very frequent in Anustubhs of Vinaya Pitakam.

tubh rhythm of IIS ISS IIS ISS born of the Indravajrā specimen. There is hardly any stanza of identical pāda in Tristubh of this earliest nipātas.

Catukkanipāta verses have general uniformity with those of early Nipātas but rhythms appeared to be more varied instead of being rigid.²

Of the 200 stanzas we have 61 pure Anuştubhs, 7 Mahāpanktis (consisting each six dimetre verses). 25 pure Epic anuştubhs and 63 irregular Epic anuştubh.

Of the 34 Tristubh stanzas the characteristic form is the curious blending of Upajāti and Śālinī – Vātormī with only Upajāti ending³, whereas Epic Tristubh makes provision for both groups⁴ in which 7th is more free than that of Catukkanipāta. And only 12 occasions provide for the long 7th syllable exhibiting Śālinī-Vātormī rhythm in the cadence. And in eight of these we have Upajāti opening and Śālinī⁵ ending. In this respect it bears more resemblance to Bhārata Trisṭubh than to those of the Rāmāyaṇa, where the Upendravajrā and Indravajrā are the exclusive forms of Trisṭubh against the variegated pādas of Bhārata. In two Jagatīs² we got two hypermetric verses with the

Vide infra — In Vinaya Piţakam this specimen is found in Trişţubha stanza, but here in Jagatī stanza.

^{2,} D.K. Guha. JRASB. XIII. 1947. P. 62.

^{3.} U-U-UUU-U-U

^{4.} U-U-UUU-U-U

^{5.} U — U — — U — U; 3rd, 5th and 7th regulate the Triştubh pattern. When 3rd and 7th are short and 5th is long we get Upajāti, but when 3rd and 7th are long and 5th is long we get Sālinī. But when other positions remaining same, we have 5th short, we have Vātormī, and Vātormī is comparatively rare and archaic.

^{6.} Vide, Hopkins, Great Epic of India. P.296. 1901.

^{7.} These are in Vamsastha rhythm. Two shorts combinedly in the first i.e., 2nd and 3rd; in the 2nd i.e., 4th and 5th are changed into long syllables we would get Vamsastha rhythm.

rhythm UUUU--UU-U and U-UUU-UU-U
-UU.

We may make a passing reference of the metres of Chakkanipāta of which 15 stanzas of abhisambuddhagāthā are of late origin. Consequently, 126 stanzas only belong to the original part. There is no Tristubh stanza.

In all varieties, the familiar cadence in the uneven padas are U--, U--U, the occurrence of which in pure Anuştubh is 50%, in the Epic Anuştubh 50% and in irregular Epic 76%.

The only Gāthā which does not fall to general category belongs to (6) Gāthā of Jātaka No. 380. The peculiar characteristic is that it has got nine syllables in each of the first two feet and eight syllables in each of the last two. Such a peculiar type can be met in the Catukkanipāta in 320 (ii). These remind us of the specimens found in 1. 187.11 of the Rgveda. It may be said incidentally that this Nipāta is much later than the previous one which contains 8 verses of the Vedic² type.

To the middle stage, can be assigned the anthologies, known as Therā and Therī Gāthās which are supposed to be uttered by the therās and therīs surrounding Buddha during his life time. The antiquity of these verses can be estimated from the version of Dhammapāla who attributed some of them to Vitašoka and Tissokumāra, the brother of Ašoka. It has been further adduced that these anthologies must have received their final shape at the third Buddhist council.³

The verses are enshrined in both syllabic and moric metres. The Arya metres appearing here can be regarded

^{1.} Vide Arnold, Vedic metre, type 32, P. 246.

 ^{317 (}i, ii, iii) and 324 (iii) are lyric; 301 (i) is semi lyric and (iv) is peculiar combination of trimetre feet; 309 (i) is Pankti and 302 (ii) as described above.

^{3.} B. C. Law, H. P. L. Vol. I. P. 40.

as arch type of the Arya. In these too the Amphibrachys occurred in the odd pada. In some of them the gana system has not been followed.2 The instances of the regular Aryas also are not rare.. These are no doubt of late origin.3 But noteworthy is the fact that the Aryas employed here are of Vipulā type, which without any doubt represent archaic as well as non-classical form.4

As for the syllabic metres, we see those like regulated Upajāti" which in earlier Piţakas were absent, like the pāda having Mahendravajrā⁶ rhythm along with other Upajāti types, like regular Vaitālīya, which can be met in budding form in Jātaka and other archaic Pali works.7

Besides, there are the use of classical ornate metres, like Rucirā,8 Rathoddatā,8 Mātrāsamaka,10 Āryā Gīti11 and

Jagat¹ with Vamsastha rhythm – our statistics accord with the opinion of Keith, who thinks that in the period of Patanjali the compilation of the anthology have been completed. From the data given above, the fact becomes almost self-evident.

As for Anuştubhs, it can be said, that the specimens, collected from the verses of Therā and Therī Gāthā show more affinities to Epic ślokas than to the Vedic ones. Out of 2662 pādas, 20)4 exhibit pathyā ending and the pattern—U-U-—exhibits largest number of occurrence (177) whereas the Di-iambics——U-U-—appears only four times. The rhythm of the even pāda bears fixed pattern U-U U, inherited from the Vedic Anuştubh. Exceptional cases account for only 29, which may be due to variant reading and other³ reasons.

Suttanipāta, another compiled type of work containboth archaic and modern verses. Anuṣṭubhs bear the average Pāli specimens. Most of the verses are syllabic, of which many contain Upajāti rhythm. The peculiar Mahendravajrā like other Pkt verses, also appears many times. 4 Of the moric metres, there are Vaitālīyas and Aupacchandasikās but the Āryā verses are totaļly absent. It is interesting to note here that Keith does not find any Āryā rhythm in Pāli and on the basis of this he comes to the conclusion that as the Jaina Pkt verses have the Āryā rhythm, they are posterior to their Pāli counterparts.

Like the works mentioned before, Dhammapadam and

 Suttanipāta by Anderson and Smith, 1948.

Itivuttakam are compiled type of works and present the specimens of both archaic and modern types culled together. The Vaitālīyas of Dhammapadam are arch type. Unlike those of Suttanipāta they are lame, sometimes not properly arranged.

Tristubh verses generally contain Epic rhythm. Of the 149 Tristubh pādas, the 5th is long in 131 cases and is short in 18 cases and for the 7th syllable which is regularly short in Epic are long in 21 pādas² whereas out of 448 cases of the Vedic pādas one can meet with 273 cases of the short and 178 of the long 5th.

As for the Anustubhs, Dhammapadam exhibits a close affinity in the preservation of the Vipulā patterns with Pāli works of somewhat same age. Most frequently used pattern of the 2nd foot of the odd verse is U — U which comprises 80% of the total verses. In the opening, the most prohibited forms are Tribach (UUU) and Anapaest (UU –). The former occurs only thirteen times in this work against 73 occurrence of the Therā and Therī Gāthā. Besides, in even pādas we meet four times tribach and four cases of Anapaest.

Itivuttaka³, a collection of Buddha's discourses has been taken here for metrical analysis. The syllabic metres used here, comprise Anuştubh, Triştubh and Jagatl. As for Anuştubh most frequent specimen is U – U in the odd pāda which forms about 80% of the total verses.

The Bad Vipulās, i.e., UU-U, U-UU, --U U are almost non-existent. The former is sporadically found in the Mahābhārata but is rare in the Rāmāyaṇa. It occurs only 2% of the verses in the work concerned. Di-iambus which has regular occurrence in the Rgveda and ancillary Vedic

literature, has very limited occurrence in Pāli works, With reference to next specimen, it confers one and half per cent of the average occurrence. And most popular Vipula is the form - - - U to which Buddhist Skt works show a more unbalanced preponderance than the classical Skt works. In Thera and Theri Gatha and Jatakas frequency of the occurrence of this pattern deserved notice. The 'opening' portions deserve special consideration here because of the fact that greater freedom has been exercised in them in comparison to that of the 2nd feet. Though there are sixteen variations, yet for the anticlassic norms UUUU, U UUthere are very few restricted places. Itivuttaka verses make provision for nearly 11 cases of UUU-norm where as in Jātakas there are only 47.2 The most common first group of the first feet in all these four works are -- U-: -U--: --- and second group are $U-\overline{U}$, UU--, U--but for our work the first group predominates.

As for the Tristubh and Jagati there occurs practically no Salini and Vatormi group, i.e., no long third syllable. Only two have short fifth, i.e., the breake of the Vatormi and three have a long seventh at the ending of the same group. And the norms of the Tristubh and Jagati are U-U-U-U-U-U and U-U--UU-U-U respectively. In Jagati we met with two times the Vaisvadevi opening. Besides, there are metrical passages not taken into consideration here since their authenticity is to be questioned.

Some prototype of the Ardhasama metre can be found:

Late century Pali works have no separate entity from those of classical Skt works. They used regular classical metres. Telakaţāha² gāthā composed by an anonymous. poet, was written in classical Vasantatilakam metre. Dātuvamsa, varied types of metres have been used for continued description and like classical Skt Kāvyas metre is changed at the close of canto where generally long metres. have been preferred. Mandākrāntā has been chosen for the 2nd chapter, Sikharini for the 3rd, Prthvi for the 4th and Sragdharā for the 5th. In the 4th one the metre Kāmadattā4 predominates. Pajjamadhu⁵ is an elaborate poem of 104. stanzas ascribed to venerable Buddhapiya of the 1100 A.D. It was composed in ornate Vasantatilakam metre. author had time to time displayed a wonderful trick of applying short, rendering it into Upajāti type of Śakkvarī class and helped somewhat to mitigate the weary effect of continuous use of the same metre.

III. JAINA LITERATURE

Sacred books of the Jainas are written in Jaina Pkt, which however bear more affinities to Pāli than Pkt of the later ages. These books are old and avowedly older than the Skt literature as well as the literature of the Northern Buddhist. And chronologically, the position of these sacred works will be in a period between the Pāli and the oldest work of Buddhist Sanskrit.

Earliest recorded literature of the Jainas are the twelve Angas of which the Ācarangasūtra¹ and the Suttakitanga² are written in verse and may be reckoned among the most ancient parts. Metres employed in these works are Tristubhs, Ślokas among the syllabic metres and Āryā and Vaitālīya among the moric metres.

In Suttakitanga, besides Tristubh³ we have verses enshrined in Vaitālīya⁴ in which the trick of Rhyme (Yamaka) along with the name of metres makes it more lyrical and appealing. Weber thinks the chapter to be the origin of this metre, because the name of the said metre has been stitched there whereas Jacobi sought its origin in the hand of Māgadhikā or Vaitālika, whose profession was to recount the ancient tales.

Vinayam- blending of Sālinī and Upajāti rhythm,

^{1.} Ed. Walter Schübring - 1910

^{2.} Suttakitanga—SBE XXII 1884

These Trişţubhs are younger than that of Buddhist Sacred Texts but archaic than those of Lalitavistara.
 Suttakitanga—5 — 6: Ethham pajane Uvaiyamana arambhamina

^{4.} Compared with the common Vaitālīya of the Skt literature, a small number of which occur already in Lalitavistara. Vaitālīya of Suttakitanga must be considered to be the representation of the earlier form of the metre. cf. Jacobi, S.B.E. XXII. Part.I. P. XLI Veyāliya, Vetālīya is one of the portion of the 1st Śrataskandhas of the 2nd angam of Suttakitanga. The verses of the very chapter are composed in ślokas, Vaitāliyas and Tristubhs but not in Āryā. Vide Weber, Indian Antiquary, XVII. P. 345.

In the Uttarājjainya Sutta, there is a fine blending of syllabic and moric metres. The cause of the peculiar mixture can be realized easily when the length of the said metres as well as the later portions of the each of the specimens are taken into considerations where the patterns are identical. But in Vaitālīya chapters such specimens are totally absent. Admixture of the pure Triṣṭubh Jagatī in the first and the last stanza of the Ch. 15 of the sutta and in the last third of the Ch. 10 of Daśav, leads to assume that they are later intruders and accretions to the Aupacchandaśika stanzas.

But there is also verse where the rule of substitution of one long for two shorts has enabled to maintain the rhythm of the scattered Mahendravajrā.4

There is neither prose nor any Aryā pāda. But both the Suttakitanga and the Ācāranga Sutta contain the Āryā stanzas of Archaic type in a sense not conforming to the classical findings. Younger Āryās however can be found in the later Siddhāntas and the Lalitavistara. In archaic Āryā ISI gaṇa is more frequent in the odd gaṇas than the younger ones which is strictly prohibited in classical manual. Another

^{5.} Jacobi. S.B.E. XXII. P. XLII—Jacobi thinks these are parents of the common Āryā.

^{6.} Ācaranga sutta—ed. Walter Schübring—1910 Sattha parinna—P. 3. Ihamca Khalubho anāgarānām udayam jīva viyāhiya Sattham c'ettha anuvii paşa pudho pareiyam.

Anthology: — Uskāmiva joimālinīm Subhuyamgāmiva puskilatam Vivudho jo dama Vattinim, Mui so suhio bhavissai

point that deserves mention is that these Aryas are all Vipula type, i.e., containing Caesura exceeding three ganas. Fifty three verses of the chapter, designated as Itthiparinna, which belongs to Suyakkhanda, one of the four texts of the Siddhantas exhibit the Arya pattern of Vipula type.

Alsdorf¹ designates it as old Āryā because, Āryā usually contain Caesure after three gaņas. Besides, there are verses enshrined in Gīti type i.e., containing no short in the sixth of the 2nd hemistich. In short, the general characteristics of the Jaina Canon are:—ISI in 2nd gaṇa, SS in the third and the fourth gaṇa with a short in the beginning, with these patterns, sometimes, one will find SS in the first constituting śloka form. Like the Pāli verse, in the verses of Ārṣa Pkt the 5th gaṇa generally contains the ISI. But later Jaina works avoid these irregularities and exhibit the tendency conforming to the classical tradition. But majority of the metres are syllabic by nature.²

Weber³ has drawn our attention to the fact that the oldest metrical portions of the texts are composed in slokas and not in Gäthäs in which we find different kinds of metres. Müla sütras are preserved in slokas where-

as Nijutti and Cūrnī retained developed metres. The literature consulted above are the sacred works of the Jainas, but in the following paragraph we will make a fine note on the metrical specimens appeared in the classical Jaina literature. The earliest extant work in Pkt was Paumacariya¹ of Vimalasūrī which was supposed to be composed in the early period of Christian era. The principal metres in this Kāvya ara Gāthā and its varieties. Among the syllabic metres along with Indravajrā, we met not only Śārdulavikrīditam but a giant Daūdaka with eighty four syllables in a pāda.² Most noteworthy fact is that, side by side there are Apabhramśa metres like Galitaka and Śarabha with rime at every pāda.⁴ Incidentally, can be referred to here another Pkt text designated as Paumacariya ascribed to one Svayambhū³ who employed only Apabhramśa metres.

In Puspadanta's Jasahacariu⁵ we find only restricted number of Apabhramsa metre like Paddhati and Kadavakas along with a number of Varnavittas like Vitāna, Panktika, Bhujangaprayāta, Citrā, Sragvinī and Vibhābarī. These Varnavittas are internally rimed and are eligible to be sung. In periods following the above mentioned poets, Jaina monks assiduously cultivated Skt, Pkt and Apabhramsa languages. With the advancement of the Apabhramsa and Pkt metrics, we will find that as a general trend, the proportionate use of Skt syllabic metres decreased in comparision with the use of non-Skt metres. Out of regard for the Skt metres, the Jaina monks even in late century used varied type of syllabic

metres. 1 Dharmanidhāna in the 14th century was written mainly in Śārdulavikrīdita metre. Ratnasekhara in the 15th century composed a hymn in 24 Mālinī verses and the 25th one is in Śārdulavikrīdita. In Karkauda cario (circa 1065 A.D.), 2 apart from the Pajjhatikās and the Pādāku lakas, mainly used for continued narration, syllabic metres are employed for the closing verse.

The same tendency may be noticed in the Bhavisatta-kahā³. Of the Varņavṛttas employed in this Kāvya, most extensively used Bhujaṅga-Prayāta in one verse of which, the name of the verse has been included.⁴ Besides, Saṅkhanārī,⁵ Sragvinī⁶ and Cāmara⁷ there are verses where the process of substitution of one long for two shorts has been applied.⁸

In comparatively recent period, the stotrakāvya of the Jainas are written mainly in syllabic metres and sometimes contain such a specimen as can not be found in the early Skt manuals but has been appropriated by Hemacandra in his manual.⁹

IV. EPIGRAPHICAL LITERATURE

In the chronological history of Skt metrics where we are solely concerned with the metrical compositions, we can by no means do away with the Epigraphical literature which also contains a considerable quantity of compositions. It will not be an exaggeration to say that it is indispensable for the study of Skt metrics, because from these records we can have some reliable data which definitely point to some particular date or dates. Needless to say that no other source is so helpful to the study of the chronology in the whole range of Skt literature.

According to the languages used in the inscriptions they belong mainly to three periods. In the order inscriptions, the language is as a rule, non-Skt, i. e., either Pāli or Pkt. Of course, occasionally Skt can be found as in the case of Māthurā inscriptions. In the next period, both Skt and Pkt are used simultaneously but the latter disappears gradually. Lastly, in the South, Canarese captures the seat and in the North and abroad, the inscriptions are entirely in Skt. Generally speaking, inscriptions found in the South are in Skt and in Canarese, both in Canarese character.

But among the vast multitudes of epigraphical literature, we have for our purpose selected only a few ones and needless to point out here that the earliest ones of them are not in Skt but in Pkt. Such a type are those which are found in Pipwārā vase and Rāmgarh hill inscriptions. It had not yet been decided which of the two inscriptions is the earliest. Relying on Fleet and Thomas's version we however, may take the Pipwārā vase inscription to be the earliest. Both the authors find in this composition an Āryā form

^{1.} JRAS. 1906. P. 711.

which violates the prescribed rule. Incidentally, we may refer to another verse, engraved on satellite vase collected in Peśwār Museum. Thomas found in it a hemistich containing rhymed ganas of five mātrās with concluding spondee. Fleet tried to restore it in the well-known Upagīti metre. Rāmgarh hill cave inscriptions provided two metrical records found in the Sitābengā cave and in the Jogimārā cave.

M. L'abbey Boyer⁵ took the former as the demiśloka whereas Block⁶ tried to adjust it in Āryā frame but not with success. In fact it can be framed into Głtikā type of Canarese prosody.⁷ The well-known verse⁸ in Jogimārā cave inscription can be scanned as Mātrāsamaka Tripadī type. But as no such type is known to any extant manual, Venkatasubbiah⁹ tried to scan it as Tripadī type and found the same rhythm in the verses of Pipwārā vase and Peśwār vase inscription.

Thomas found again some metrical scheme in the follow-

ing composition of the Rock edict inscription, viz., Girnār 6th Rock edicts.

This is a verse of Mātrāsamaka type which contains sixteen mātrās in each pāda with some irregularities.² In the early centuries of prechristian era elegant metre like Bhujangavijīmbhita can be found in the Brāhmī inscription of Sodāsa which has been assigned in the early christian era.³ Hence from all the available records in metrical forms beginning from the earliest time, we see that Skt classical metres have established themselves in their stereotyped form of course with some solitary exceptions. To put it in a nutshell, it can safely be said that whether in India or aboad, all the epigraphic records in Skt verse form are composed of syllabic classical metres and exceptions are very few and far between.

Vocānh inscription⁴ of Campā has been credited to be written in elegant ornate metres like Vasantatilakam and Sārdulavikrīditam. The inscription has been dated 2nd or 3rd A. D. on grounds of Paleography.

^{74.} Select Inscription No. 78. P. 503. 2nd ed. Dr. Sircar thinks it to be belonged to 4th century A.D. Late Date of the inscription has been supported by Smile Gaspardone in Journal Asiatique CCXL. 1953. Pp. 477-85.

Inscribed verses in far away Kamboja¹ show that even outside India, Vasantatilakam and Śārdulavikrīḍitam are the most favourite of all metres. The four rock inscriptions in Batviā, exhibited their efficiency in handling classical Skt metre like Sragdharā.² It is interesting to mention here that the Āryā verses found in the inscriptions of the far East seldom retained the gana system like classical Skt.³

In the records inscribed in the reign of the Gupta Emperor during the years 350 to 5:0 A.D. we get only the Skt syllabic metres like Sragdharā, Śārdulavikrīditam, Vasantatilakam and Āryā which in this period does not conform to the classical stand. Kanakara stone inscription produced a solitary verse in Śārdulavikrīdita. But Harisena preferred more the long metre usually consisting of no less than 17 syllables. Vatsabhatti's prasasti of the 5th century A.D. contains forty four verses all of which are in Skt syllabic metres. What is notable is the frequent use of the weak pauses which occur in ten Vasantatilakam, two Upendravajrās and one Āryā.

The half verse inscribed on the coin of Kacha⁷ exhibits fine regular Āryā pattern whereas Āryā verses found in

the copper plate at the time of Buddha Gupta followed no gana system. 1 Besides these, the metrical compositions found in inscriptions show either Sardulavikrīdita or Sloka metreor Sragdharā.2

Southern India has cultivated more assiduously the moricmetres of meliculous types in their own way than the other regions which are more inclined to the stereotype form of Skt syllabic metres. Talgunda inscriptions of the Kadambas. in the middle of the 5th century A.D. can be taken as an instance to be cited here for its rimeless series of moric metres (1-24) along with syllabic or orthodox Skt metres. Asthey are not amenable to usual way of scansion, Kielhorn described them to be the "unbekannten." These metres areof Southern Canarese type being based on Misra ganas. These have been appropriated by Nagavarma of the 10th. century A.D. The metres found in them are Gitikas.4 Most. curious fact that deserves mention here, is that the same. inscription contains a long metre like Dandaka containing.

First line contains—30 mātrās

and the second -27 mātrās. Udgīti type.

thirty syllables in a pāda. In Ajanta cave inscription of Harisena dated 6th century A.D. on the Paleographical ground among a large number of stanzas in Skt syllabic metres it is found to have contained some verses (6-9) composed in the moric metre of Gītikā type. The Taṭṭukoli inscription belonging to a period about 7th century A.D. ralso provides us a metrical composition, of course in Canarese language. The lines of this inscription may be scanned as Tripadī type of Miśra gaŋa. The given inscription is sufficient to show that Gītikā type of moric metres have been more frequent in Canarese and Skt during the 7th centuries and more assiduously cultivated in the south than anywhere else.

In the early centuries, Canarese metres like GItikā etc. are frequently used in the Skt inscriptions of the Southern. India. But in late centuries in Canarese Inscriptions of the same region, long Skt metres like Mattebhavikrīḍita, Mahāsragdharā⁴. Siddhi appear frequently. Most noteworthy point to be mentioned here is that among the metres stated above, the first two have been dealt with by the Southern prosodists like Jayakīrti, Hemacandra and Nāgavarmā, whereas Siddhi was first employed by Māgha, also a Southern poet, under the designation of Dhītaśrī.

Nāgamangala Taluk⁵ of the 12th century contained all these metres mentioned above in their Canarese verses. Devanagare Taluk⁶ of the same century produced most:

interesting inscriptions where both Skt and Canarese verses are inscribed side by side. The said inscription commences with the Skt verse containing moric metre with thirteen mātrās in each pāda. The metre has been appropriated by Kavidarpanam only. The verse following it is in Vasantatilakam metre. Next one is Aryā with four pāda. Amidst them there are verses in Canarese language with syllabic metres.2 Some of them retain a new rhythm not found elsewhere except in the manual of the Southern prosodist Nāgavarmā who designates it as utpalamale. We need not awell the list by reproduction of an unending series of inscriptional metrical records, because most of them contain the syllabic metres of orthodox type comprising Sarvasama and Ardhasama syllabic metres.4 We may close our survey by referring to Peholi Prasastis during the reign of Mahendrapāla of the 9th century, which contains a verse of Gāyatrī class in which all the components are long.6

V. BUDDHIST SANSKRIT LITERATURE

During the period extending from the 1st century B.C. to 4th century A.D., we come across a particular type of Buddhist literature written in a language which is other than Pāli and Pkt. In genera these works can be termed as Buddist Sanskrit works, which can be categorised into three groups according to the metres and languages used in them. Leaving aside the issue of language we would dialate on the metrical principle applied in these works, which would help us in forming these groups. As evidence, limitation of scansion is obvious; it must be supported by other factors, but one should not deny that it can give support to others.

(1) The language used, in premier group, is Buddhist hybrid Sanskrit. The metrical portion of it is generally used to be written in gāthā dialects or in mixed Skt. Edgerton thinks many of its features have been inherited from the proto-canonical Pkt. Language represents certain peculiarrities which may be described as middle Indian and Prakritic in broad sense. These peculiarities are exhibited fully in the verse portions, where Barnauf, found a barbarous Skt in which the forms of the ages of Skt, Pāli and Pkt appeared to be confounded. The peculiar verse models and stanzas of these works are such that in the languages of Lefmann³. "The language of this Gāthā or the verse forms which comprise more than half of the Lalitavistara is such a type, that is between folk type and artificial collection or well ordered expression, between Pkt and Skt fluctuating to and fro".

This language peculiarities are clearly discerned in the premier group, where Prakritic and Pāli influences are acute and glaringly exposed in the compositions. So far as metrical specimens are concerned, we find in Anustubhs appearance of Bad Vipulā and predominance of M Vipulā. The

^{1.} P. 39; Kuppuswāmī commemoration volume.

^{2.} BSOS. VIII. P. 502.

^{3.} Vide Introduction, Lefmann, XVIII. 1908.

verses other than the Anustubhs are apparently of quantitative type and are to be scanned by the strictest rule of the Skt scansions of course with some minor restrictions viz., where two shorts may be substituted for one long and vice versa, metricausa. This substitution is much more common in the initials than in the 4th or 5th and more or less in other parts also. This principle is applied mostly to Tristubh and Jagati, excepting some classes found in the compositions of Lalitavistara² and Rāstrapālapariprccha.³ To this group can be included the works-Lalitavistara. Saddharmapundarīkasūtram, 4 Samādhirāja 5 Sūtra, Gandavyūhosūtra. 6 Ratnaguna⁷ samuccaya and Rāstrapālapariprecha. The second group is more ambitious and less hybrid Skt in the sense that they retain some of the affinities of the first group such as metrical specimens of Anustubh, showing preference for Bad Vipulas etc., but lacking some chracteristics in verse froms where the manifold liberties have been allowed with the language to attain the metrical result.

The third group on the other hand, is purely classical so far as metrical specimens are concerned. Only remarkable feature that can be counted in this case, is the unbalanced dominance of the First Vipulā which goes side by side with M Vipulā in other classical works.⁸

Edgerton, Vol. LXVI. JAOS. 32. It should be borne in mind that
this principle has been applied in all old Texts in canonical works
of Buddha and Jaina.

Lalitavistara. P. 126. R.L. Mitra's edition. 1877. 13th long of a Sārdulavikrīdita has been splitted into two shorts.

Whereas in Asvaghosa—Saundarānanda—669P 10/M, 8, 81/1st.

In the second group can be included Nāgārjuna's Madhya-makārikās, Lankāvatārasūtras etc. In the third group on the other hand, we have the works of Buddhists like Aśvaghoşa, Mātrceta and Aryasūra which bear almost classical patterns so far as philological and prosodical acumen are concerned, containg however here and there some expressions or usages which are foreign to the classical Skt literature.

So far as the Anuştubhs are concerned, the following specimens found in Buddhist hybrid Skt works, i e., in First two groups, deserve special mention, for they show some affinity with the Anuştsubh in Pāli and Pkt works.

Bad Vipulās, i.e., I min, I maj, and D reappear in these works as they continue in Pāli². The reappearance of them at such a late period is due perhaps to the close connection of the Buddhists with Pāli works. In contradiction to this the third group or classical type of Buddhist Skt works appear to have discarded these Bad Vipulās.

Again, M Vipulā which predominates in Pāli3 seems to

Buddhacarita -535P 7, 8, 50 Mātrceţa -254 6, 9, 33. 1. For these two works, the scholar has utilized the figures of the metrical specimens of Morton Smith-(I. Ir. Jr. Vol. V. P. 28). 2. (First group) Saddharmapundarīka sūtram -1.0.0. Suvarnaprabhāsottama sūtram -17.4.8. etc. -1.0.1. Samādhirājasūtram (Second group) Nāgārjuna Mādhyamikakārikās -5.1.7. Lankāvatāra Sagāthakam -7.5.1. etc. 76.13.56. (Pali works) Therigatha 79.12.46. Jātaka ... 15.1.9. Dīpavamsa 14.5.4. Mahā vamsa **— 2004 195. 145. 107. 26......** 3. be the most common in the works of these two groups, but their uses become proportion tely less in classical type of Buddhist Skt works. This can be taken as due to the Pāli influence.

The important feature appeared in the verses of Buddh. H. Skt i.e. the substitution of two shorts for a long by which this literature, differed from those of classical Skt, seems to have inherited from the protocanonical Pkt. Moreover, this very feature points to the moric equivalence of Pkt metre.

Moderate preference for the First Vipulā in classical type of Buddh. H. Skt works, which is a prominent figure during the period between 1st century B. C. and 1st century A.D. cad be accounted for the Pkt influence. Morton Smith² is of opinion that the consecutive shorts are due to some factors such as disappearance of the intervocalic consonants and the simplification of the clusters. It has been further argued that the existence of the number of 1st Vipulā is due to the Gltā which showed marked preference for that Vipulā and which enjoyed unrivalled popularity during that period.

Fourth Vipulās or Diiambus appears frequently in some works. This can be taken as the cases of archaicness or Purāṇic licence. This is again sometimes due "to the adoptation of Gāthā freedom conspicuous in all popular and therefore loose composition."

Other metrical specimens appearing in these works: require separate treatment on account of their peculiarities of language in which they are written.

In the premier group, it is found, that the authors followed principles different from those that were applied in: Anustubh. The substitution of a long for two shorts (of which we have stated before) has been applied in Saddharmapundarlkasūtram on initial in 67 cases, on the 4th in 10 cases and on the 5th in 4 cases.

Most of the ballads of these works seemed to be composed' extempore, as they bristled with colloquial and vernacular forms of speech. Yet one will be amazed at the tact and the ability of the poet rhapsodists who are perfectly familiar with the most intricate principles of Skt prosody and composed with ease and elegance the syllabic metre of octosyllabic group to complicated Śārdulavikrīḍita. Side by side Āryā, Vaitālīya and even Dohaka or Dohā are pointing out the spontaneous development of different traditions and this is due to the fact that the language of these Gāthās is not "lebendige volkspruche", or mixed language, but contains the feature of a mixture of Skt and Pkt in order to be applied in various methods of versification.

Six thousand metrical stanzas of Lalitavistara present three classes of metres—syllabic, moric and Āryā with a number of their varieties. Besides Anuşubhs there occursyllabic metres from Tristubh class to Dandaka class. Verses of S. P.³ exhibit only Anuşubh, Tristubh and Jagati

varieties. In Tristubh or Jagati, mostly we have stanzas with its hybrid form, i.e., Indravajrā group with Mahendravajrā. Jagatī represents, on the other hand, Vamsastha type hybridized with a new rhythm. In orthodox manuals, both the new rhythms are absent but they have been given places in manuals of Jaina prosodists like Jayakīrti and Hemacandra. The latter chooses Mahendravajrā for the continued narration of the 12th canto of Dvyaśraya2 Kavyam. In some of the proto-canonical works also this type of hybrid verses is found to exist. 3 In Lalitavistara this type of Tristubh can be found abundantly but in Samādhirājasūtram, 4 Gandovyūhasūtram⁵ and in Avadānašatakam, it is used sporadically. In every Buddh. H. Skt works these specimens are present exhibiting the curious phenomenon i.e., substituting a long for two shorts and vice versa metri cauasa. Due to the application of this new method, the number of new specimens emerged by the resolution of two shorts into a long. in the rhythm of Pramitakşarā (UU-U-UUU-UU-).

We have the new rhythm——U—UU U—U—which has been aptly appropriated by Hemacandra⁷ with designation Utthāpanī, i.e., which has risen. This⁸ has been found in a complete stanza after being hybridized with Pramitakarā in series of verses. Musical element of it can be guessed from the inclusion of this metre in the Dhruvā chapter of Bharata.⁹

^{9.} Bharata Nāţyaśāstra — XXXII. 148. Viśloka.

As in classical literature we get hybrid form of stanza with Vaṃsastha group and Indravajrā group, so in Bh. H. Skt texts we meet with hybrid verses either with Mahendravajrā or with Manikundala.

Third type that we have is the Upajāti of Śakvarī and Atiśakvarī. This mostly appears in the patterns of Vasantatilakam and Rṣabham.² With more known Mālinī we have the combination of a new rhythm which has been appropriated by Jayakīrti.³ Finally, we can refer to the hybrid verses of Atidhṛti and Utkṛti, containing Śārdulavikrīḍita and Mattekhavikrīḍita, the latter being the favourite to the South Indians as can be evidenced by their occasional appearance in the Carnatic Inscription⁴ and inclusion of the same in the Carnatic manual.⁵

In this connection we must recall in mind, the place of origin of the Mahāyāna School of Buddhism, under whose influence the Buddhist Skt literature developed to a greater or lesser degree. It became an accredited fact that though in some Hīnayāna text like Mahāvastu we find mixed Skt, yet most of the extant texts written in hybrid Skt have been originated in the Southern India. Mahāyāna school made its first appearance in Andhra where the Mahāsangikās had their

centre and already in Kaṇiṣka's time it got recognition and was spread all over North India.¹ Besides, we have another peculiar type of hybrid metre, in which Dodhakam has been hybridized with a new rhythm UU-, UU-,UU-. This type of Upajāti metre has been extensively used in Gaṇḍo-vyūha sūtram² in which we find a prayer³ in sixtytwo melodious Dodhaka stanzas. This Dodhaka is the favourite metre of the Mahāyāna Buddhists.⁴ Second class of Varņa Vṛtta employed in Lalitavistara, is of Tālavṛtta type.⁵ The first type of this class afforded by this work is that which consists of any number of Iambic⁶ and Trochaic⁻ rhythm.

Another type found in the stanzas consists of IIS ganas of any number. Still another kind consisting of five SII ganas with a final long can be found in many places. Sometimes they are united in hybrid form with Totaka rhythm being intermittently rimed.

In these Gāthās strict principle of the law of versification has not been fully maintained. This tendency perhaps tends to show that they owe their origin to Pāli language. 10

In these innumerable Gāthās one can find out various types of metrical patterns not appropriated by the extant

manuals. Thus we have beautiful Mātrāsamakam with fixed syllabic¹ form, stanzas with new pattern Masajabhagaga² which appeared in the verses of Rāṣṭrapālaparipīccha and in a hybrid stanza of the aforesaid metre with a new rhythm IISSII SIS ISI ISS.³ The last mentioned rhythm has been born out of the aforesaid rhythm by substituting the first long by two shorts. In ch. 15th and 16th of the Lalitavistara, we find an extensively used rhythm ta ta na⁴ ra ga. Among the much known Sarvasama Vīttas found in Lalitavistara, are the Rathoddatā⁵ along with other forms of Triṣṭubh group and Danḍaka types.⁶ Ardhasamavīttas like Puṣpitāgrā.⊓ Vegavatī, are also found sporadically.

As for Aryā verses, there are stanzas with regular gana system, like classical ones and there are such ones whose two

hemistiches contain total count of syllabic instants1 in their respective parts and such types which admit amphibrachic in'odd2 pādas. Finally, we may close our survey by mentioning the occurrence of Vaitālīya and Aupacchandasika metres, very favourite to Jainas and Buddhists. Incidentally, we may refer to the pure matra metres like Doha,3 Rola,4 Mālā⁵ and Abhīra⁶ found in Lefmann's edition, which R.L Mitra's edition have in quite different version. In the treatment of long syllabic metres the remaining groups are just like our classical ones. We need not prepare a statistical list of the metres employed by them. We will sketch out here only those lines showing peculiar characteristic marks in the verses employed in these texts.

Divyāvadāna is a complied type of work containing the material from the old text holding in its limited scope different traditions. Thus we meet here the non-classical Arya, 7 hybrid type of Vaitālīya8 on one side and regular classical syllabic metres from Upajāti to Śārdulavikrīdita on the

other. Here also we have the Buddh. H. Skt metres¹ and peculiar type of Upajāti² of Rucirā with another type of verse which like others differs from Rucirā type only in initial which is long in the latter.

Aśvaghoşa in his two works Buddhacarita and Saundarānanda kāvyam showed a special skill in handling the rare metres in a remote age. This celebrated Buddhist among the widely used classical metres, employed some new ones not usually appearing in classical literature.

Most remarkable is the Vişama VItta Udgātā used for continued narration in Saundarānanda, Sarabhalalita and Vardhamāna with the scheme of augmenting the number of syllables. Among the long metres Asvaghoşa favoured, Sārdulavikrīdita, Suvadanā and Sragdharā appeared in Saundarānanda kāvyam and dramas. Sragdharā is very favourite metre of Buddhists especially of those who wrote their works in Skt language.

It is evident from the preceding deliberation that Bh. H. Skt texts retained varied type of metrical specimens enshrined in the composition of different languages. As the languages of these texts are closely related to Ardhamāgadhī and Apabhramsa, the writers allowed themselves with the

manifold liberties in order to attain the metrical results. In this it can be expected that they conform to the tradition of the Pkt dialect from which they started. As they belong to the transition period, special features of their metrical peculiarities speak of their special inclination on Skt tradition, consequently to the syllabic metres. That is why except very few which can be found in Lalitavistara, the vast multitudes of the verses have Skt type of syllabic arrangement coupled with occasional substitution of two shorts for a long

VI. EPIC LITERATURE*

The period succeeding the sutras was characterised by many sided literary activities throughout India. The literary products of this period may be categorised, according to their contents, under three main heads, viz., religious, philosophical and secular. The rise of different religious sects, i.e. Brāhmaņas, Buddhists and Jainas each with rich and distinctive literature of its own, is the marked feature of the literary activities of this time. Philosophical dogmas of the Upanişads cultivated in their own way under secluded atmosphere by the hieratic class is another phase of literature of this period. Direct flow of Brahmanic cult with the last remnants of the Vedic literature is also no less insignificant. Side by side a secular literature in the form of Epic presented a distinct phase in which literary development though a free and less polished but more practical form of Skt was employed for shaping a literature not hieratic but no less aristocratic. In strictest sense, it cannot be called popular

^{*} Abbreviations used in this section :—
(Mahābhārata MB., Rāmāyaņa Rāmā.)

but it was after all loved by the populace. That the literary peculiarities which this type of literature possessed are solely of its own denies the theory of Pkt originals and these must be traced ultimately in an unbroken tradition of Skt inherited from the Veda. The Epics as we have them are products not of a single hand, neither of a particular period, but they are really a jumbled up mass of literary products belonging to different periods and to a good many authors. Even the critical editions could not clear up the mess with any spectacular result, though they endeavoured to sieve out a considerable portion of the vulgar texts. Examining the relative patterns of the existing verses in the two great Epics we find that the metres of the Epics reflect heterogenous traditions, presenting themselves in different groups. The prevailing groups are the syllabic and the moric, the former represents Brahmanic traditions and the latter Brahmanic, 1

The great Epics present following groups of specimens based on syllable: the free syllabic rhythm in form of Tristubh and Anustubh—the latter of which is the principal metre as has been chosen by the Epic versifier because of its inherent quality of easy felicity of narrating the heroic tale.

The Tristubh, on the other hand, in the early composition has been arranged with very little restriction—consequently committing a variety of verse norms in the MB and reduced to one prevailing type in the Rāmāyaṇa because of its surrender to classical restriction fallen upon it,

The Vipulā figures are collected from Rg Vedic 400 Anuştubhs. — Indo Iranian Journal. V. P. 26.

M ---
T -U-U

being the earliest Kāvya in the classical age.

Jagati pattern more or less made their appearance now and then along with these Tristubhs. Fixed types of any norm of this class are common in verse form but rare in stanza form.

The refined classical rhythm differs not only from that of the Epic but also from those of Puranas in employment of the 4th Vipula, in the inclusion of the combination with Dijambus and Pathya, in preference of the 2nd Vipula over the 3rd Vipula. The foregoing statistical discussion. though appears to be somewhat boresome, will enable us. to determine the relative position of the Epic between the Vedic and the classic.

The popularity of the Vipulas in the Vedic pattern. stands in such order -D, π , I maj, X, P, I min, M, T. And the emergence of π as the most common mark of regular Vipulā in pre-Gupta age and the frequent appearance of the same in some part of the Epic literature speaks of the relative chronological development of Epic.

Practically, there is the Epic usage in respect of the proportion of Vipulas to Pathyas.1 The first Vipula or Paeon the favourite Vedic pattern after Diiambus, can also be found in considerable places and X (choriumbus), M (Molossus, T (Trochee), I min, I maj are not rare. Again, Pathyā form occupied the considerable portion. This can be accredited to the fact that the different parts. of the Epics have been committed by the divergent personality of the different ages.

The complete absence of the Trochee in classical norms2 and the number of occurrences of the same in Manu and in some parts of the Mahābhārata speak of the relative:

1. Hopkins, Great Epics of India -P. 223. 1901.

^{2.} Kālidāsa has one trochee in Kumārasambhayam. But this is: completely disappeared in the Kāvyas from Aśvaghosa to Bhāravi.

archaic nature of the Epic.\ Incidentally, we can only make a passing reference to the norms appeared in the Purānas2, which sometimes differ from the refined classical ones. In 500 slokas of the Väyu (Ch. IV-IX) only 15 Fourth Vipulas can be found. Agni Puranam provides for the fifty seven of this specimen in 505 slokes (Ch. I-XX). On the other hand, lateness of Puranic choice over that of the Epic in case of the selection M (3rd Vipula) over the X (2nd Vipula) proves unhesitatingly the approximity to classical age4. The Gītā in its 500 ślokas (830-1382) shows proportionately less favour to the 2nd Vipulas, though retains marked preference when compared to those of the 3rd. 2nd Vipula occurs only twenty-nine times against eleven instances of the third.

In its inclination to the third over the second and in its marked preference for the 1st, the Ramayana approaches more to classics. But it is more archaic than classic where it favours the 4th more which the classical literature lack totally5. Practically, in so far as the use of Vipulas are

concerned, the Epic shows an unstable trend. The relative proportion of the 4th Vipulā in the successive parts of the Aśramaparvan will imply the classical characteristics in the same. Four or five cases in thousand hemistiches bear a sharp contrast to one part in which there occurs five 4th Vipulās 'in 35 ślokas. In another case also in successive thousand hemistiches only three 4th Vipulās appeared. Thus some parts submit quite contradictory results. Similarly, in some fascicules of Dronaparvan we find the same contradictory result. Thus the chapters 72-84 are more classic than the 51-71, whereas the chapters 92-100 show more archaicness.

In the Karna (Chs. 18-29), in the old tale, it presents only seven, 4th Vipulās in 550 verses whereas in the Sabhā it is thirty six in thousand verses (Chs. 11, 50, 33-34). Jatugrha and Hidimbā stories place thirteen 4th Vipulās in thousand verses whereas in Virāṭa (Ch. 325-825) in the same number of verses 4th Vipulās count only six.

In three more fascicules of thousand verses collected from the Gītā, the Śānti and the Rāmāyana Chapter III, 1-60 verses we could have quite another picture. Among the three Anuştubhs in the Gītā sṭands in her antique gravity², whereas those in the Śānti, are almost on the metrical par with those of the Rāmāyana. Even in those

parts of the Santi which have been reckoned as old because of the inclusion of the old tale, the number of 4th Vipula is very insignificant.

On the contrary, we can present another figure that will accord with the theory of lateness, i.e., comparative scarcity of 4th Vipulā and preponderance of the 3rd over the 2nd. In thousand verses of the Udyoga (Chs. 119-133) neither the account nor the metrical appearance presents antique form.²

In spite of the anomalies in concordance and discords in existing style, the Epic śloka differs from classical model most remarkably in Vipulā preferences. The archaicness of the verses may also be proved by the statistical method, i.e., by the proportion of the 1st and the 2nd Vipulās employed in the verses. In the beginning of the Christian era, there is a marked preference for the 1st Vipulā the number of which is very insignificant in Upanişads. But it appears to be predominant in the period between 1st cent. B.C and 2nd cent. A.D.³ The popularity of this figure can be acco-

unted from the fact that the very form of it which represents UUU U, indicates the Pkt influences where the clusters of the conjunct generally used to be simplified. In other way, it has been argued that the Gītā retains more 1st Vipulās than any other figure and the initial popularity of it is due to the Gītā which everyone tries to assimilate in form and in sentiment.

The results obtained from the statistical data given above may be summed up as follows:—the 3rd Vipulā which in the late Vedic literature predominates over the two other Vipulā forms, has been dominated by the 2nd one in the age following it and then the 1st came to be prominent in the early Christian era and then again appears the 3rd.

Lastly, we are to refer here to continuous Iambic ślokas which are undoubtedly later than the other Epic forms of śloka. This is a bunch of forty stanzas successively written perhaps by some poetasters. ¹

The only Vedic remnant which lives through the ages in metrical literature is the diiambic close in the even pādas of Anuştubh. In the comparatively early literature, its frequency can be noticed, but due to heterogenous influences, this form assumes a bit altered i.e., -V-in later Epics retaining the 7th in its light form.

Besides, these Śloka forms, the hypermetric types where the 9th syllable is often attached to prior pāda exhibit all the possible forms of the close of the 1st pāda. It is more

 Mahābhārata.

^{2.} cf. Oldenberg — zur theorie des śloka — ZDMG. XXXV. P. 187. Die Enstehung des śloka Metrums datiert von der Zeit wo der Herrshaft des Iambus am Ende der ersten Vershalfte gebrochen und derselbe dort durch den Antispest ersetzt wurde. Dieser vorgang gehart einer Epoche an, die hochst wahrscheinlich hinter der Enstehung der altesten in śloken Verfessten epischen Gedichte Weit Zuruck liegt:

sional existence of these hypermetrical verses are due perhaps to the fact that the more measurement is in work in which the long has been divided into two component shorts. And this principle is more discerned in Tristubh than in Anustubh. The results obtained so far from the discussions above may thus be put in a nutshell:

The Anuştubh gets two major forms, Pathyā and 3rd Vipulā. The 2nd and the 4th Vipulā are comparatively earlier, whereas the 1st may be assigned to a period between pre-Christian era and early parts of Christian era. Diiambus and Minor Ionic appeared sporadically but became almost extinct in later Epic style. Major Ionic can be found but exceptionally. Finally, we may conclude, so far as rhythm is concerned, the Anuştubhs of the Rāmā, stand between those of the MB and of classical age. Next to Anuştubh, Triştubh pādas predominate in the great Epics. The prevailing type of the Triştubh form is U-U-followed by—UU-, -U--, UU--, "in the MB. Triştubhs however admit varied types of forms and are not of uniform type. About 1/5 Triştubh in the MB contains hypermetric rhythm which are Jagatī in form but Triştubh in rhythm.

Follwing forms are common in the existing verses:

- 1. With 3rd short, 5th short and 7th short.
- 2. With 3rd long 5th anceps and 7th long.
- 3. With 3rd long 5th short and 7th long.

The given forms make provisions for two group Salini and Upajati.

Pathyā: anubhūyatāmayam vIrāḥ: Nala, II 9.
 1st Vipulā: Prakṛtis guņān vikurute: XII, 314. 15.
 2nd Vipulā: Katham Ārṣṭiseno bhagavān: IX, 40, 1.
 3rd Vipulā: Navanītapankāḥ kṣirodāḥ: XIII. 80, 6.
 4th Vipulā: Sarņāgatam na tyajeyam V. 12. 16.

^{2.} Hopkins - Op. cit. P. 275.

Among these the first is very archaic because, it presents. Upajāti opening U-U- and subnormal Vedic break UUU and common cadence. The second norm comprises syncopated opening, 5th anceps and 7th long and the regular cadence. And last one exhibits long 3rd and 4th, 5th and 6th as three consecutive short, 1 followed by long and regular cadence-U-U. Besides these, there are other specimens in MB all of which are of archaic types.

The Rama, on the other hand, shows preference for only one form U-U-U-U-U out of the varied padas of the MB. And unlike latter it maintains carefully the uniformity of the padas in a stanza almost in the classical manner.

In the Rāmā, the Tristubhs are generally used as the closing verse of the Sargas or Chapters which are mainly written in Anustubh metres. The Tristubhs again are characterised by their regularity and their close adherence to classical Upajāti. The Ayodhyākānda admits highest number of Upajātis, i.e, exceeding the number 200, which according to their syllabic form can be grouped into two sections: Upajāti of Vajrā group and Upajāti of Vamsastha group.

We would first go through the types of Tristubh pada appearing in the Epics, then we would consider the relativeuniformity of the padas when transformed into identical stanza, with a view to examining the existing metres according to the classical manual.

In the first stage of the Tristubh form, rhythm is the first factor to be concerned with. Some norms of the Tristubh in the MB have been discussed and we will observe

^{1.} The middle foot UUU occurs not infrequently in the older Epic but in the whole of the IVth Book, it occurs but once and in the 7th book only twice in the 1280 pādas. In old Epic common are -- U -- and UU -- . Ibid, Idem. P. 313.

now catalectic, hypermetric and Morā Triṣṭubh. In all theseforms, the Triṣṭubh cadence is in work.¹ Triṣṭubh verses:
always retain the Vedic cadence and in case of the catalectic
and hypermetric verses also, it leaves the last four unaffected. This phenomenon is clearly apprehended if one
compares hypermetric Triṣṭubh with Jagatī verses which, as
has been wrongly put sometimes by some scholars, came intobeing by the addition of a syllable at the close where Trochee of the Triṣṭubh has been converted into – U—. But the
real hypermetric form is the case of the Vaiśvadevī where
the opening of Śālinī, already in the Vedic period, has been
prolonged by one long. In the rhythm of Upajāti the Vedic
versifier made provision for the late Caesura where as in the
rhythm of Śālinī Vātormī, the early Caesura has been
provided.

Epic verses generally of the MB sometimes failed to retain the late caesura in the Upajāti stanzas thus providing scope for the classical manual to be silent on this point, i.e., placing no position for any caesura. Process of insertion generally follows the 4th and this is Vedic and can be found in the Upanisads and the Buddhistic texts.

The hypermetric beginning with an anapaest instead of a long initial can be found in Buddhistic and Jaina poetry which we have shown before. The hypermetric Jagatī

came into being in the same process through splitting up of the 5th syllable which is long in the Vamsasthavila and thus giving birth to Rucirā. That is why ample example of Vamsasthavila and Rucirā in a stanza can be found in the MB¹ itself. The process which causes the stanza to be in hypermetrical can be named as the Morā rhythm and Hopkins calls this type of Triṣṭubh as Morā Triṣṭubh. This is a very early tendency and is found not only in the Epic but also in the Buddhistic and Jaina verses. The solitary case that can be found in the Rāmā. is of a peculiar type, and the authenticity of this solitary verse is open to doubts.²

In the MB, side by side, there are archaic type and classical type. Edgerton⁵ categorised them as the Sabhā type and the Virāṭa type in consideration of their location in particular parts of the Epic. Frequent occurrences of the hypermetric pādas,⁴ long third and long seventh is the chief characteristic of the Sabhā type and in contrast, in Virāṭa there is no hypermetric, no mixture of Triṣṭubh and Jagatī and practically no departure from the classical norm. As for caesura, there is early caesura, after which 5th is short very often. The caesura after the 4th is followed most frequently by an anapaest UU-(79 times) by-U- (63 times), 49 times by a dactyl and only twice by UUU.⁵ And the normal scheme after early caesura is U — U — U U

^{4.} Hypermetric occurrence is more than one in every 4 stanzas.

^{5.} Vide Hopkins. Op cit. p. 313.

U - U - which has been inherited from the Veda.

The Sabhā type, on the other hand, contains the late caesura which shows almost invariably the quantitative scheme in the classical type. There are 120 pādas in which regularity is suspended in three cases where the 3rd syllable is long and in five other cases where the 5th is short.

In the subtypes of the Sabhā there exists the Vedic type with the blending of Upajāti opening with Śālinī ending. This is of common variety comprising nearly 300 cases. Of the remaining two types one is that where the resolution of the long into two shorts after the early caesura makes it possible for the origin of the new scheme, and the other makes provision for the two shorts against initial. Of the three subtypes, the last two can be accounted for Pkt influence, where the 1st one is inherited from the Vedic and can be found abundantly in the Upanişads.

Regular type of Jagati is U-U-UU-UU and in the Adi and the Virāta there can be found 35 and 65 verses.

Pure Jagatī is of very rare occurrences in the Epics. In Upajāti forms there exist Vamsastha and Rucirā; Vamsastha and Rathoddhatā.² Rucirā is the emergent metre of Vamsastha whereas Rathoddhatā is Jagatī by nature but Tristubh in form. And of the two, Rathoddhatā is supposed to contain archaic rhythm e.g., long 3rd, short 5th and long 7th and consequently early caesura whereas in Vamsastham we have short 3rd, long 5th and short 7th with late

^{1.} Vedic metre, Arnold. Pp. 163.

^{2.} MB. XII. 8205. Natatsadah sat parisat sabhā cā sā Prāpyayāmna Kurute sadā bhayam dharmatattram avagāhyabuddhimān Yo 'bhyupaiti dhurandharonarah.

In the same parvan we find two pure Rathoddhata XII, 7126 (P. 616); and 10531 (P. 736).

caesura and in post caesura part they are wonderfully identical.1

As Jagatī in form, Vaišvadevī, holding the essence of Triṣṭubh is to be counted as hypermetric Triṣṭubh metre rather than as Jagatī. Sporadic pādas of hypermetric is not infrequent. A complete stanza occurs once in the MB.²

The mixed pada stanza is the primary form and the pure classical metres are the refinement of that mixed type. Thus we get complete stanzas of Indravajrā and Śālinī groups. A good number of specimen of stanzas showing a close approach to these classical metres are to be found here and there. In VII parvan of the MB alone sporadic Salini padas are to be found in the chapter VII, verse 2 whereas finally in the same chapter, verse 26 appears one Salini stanza. Then in VII, 54, 40, there is a series. It becomes an accredited fact that the mixture of Vatormi, Salinī and Indravajrā groups and others are the Vedic, Bhāratic (belonging to the MB) and non-classical, whereas clear cut Upajāti form is preserved by Vālmīki. Besides these, there are Jagatīs like Drutavilambita only two occurrences of which have been recorded in the MB. VII, 184, 47-48 but the Rāmā. lacks it. Bhujanga-prayāta appears once⁸ in the MB and once in the Rama.4 Atijagati Praharsini is nothing but the Morā equivalent to hypermetric Rucirā. 5

Rathoddhatā — SISI IISISIS early Caesura
 Rucirā — ISISII IISISIS Late Caesura.

^{2.} Vol. III, P. II. P. 743. Verse 10721. This Vaiśvadevī was followed by a Upajāti of Śālinī and Vātormī. Rāmā. admits only one complete stanza V, 65, 28 whereas Gor. ed. lacks complete Vaiśvadevī stanza.

Praharşiņī — — UÜÜÜ — U — U — —
MB. P. 322. — XII. 12067 — 10.

Mīgendramukha is nothing but repetition of the even pāda of Puṣpitāgrā which can only be found in the Rāmā, VI, 101, 55 which however in Gor. Ed. 85.13 appears as Puṣpitāgrā tag.

Vasantatilakam, absorbing the rhythm of the short 3rd, 5th and 7th and retaining the last seven of the Upajāti conforms more to the Upajāti rhythm than to that of archaic Śālinī. That is why Hopkins⁶ made provision for this rhythm,

ūeūste Vacanam idam nišamya hṛṣṭāḥ
 Sāmātyāḥ Sapariṣado Viyātośokāḥ. // R. II, 79, 17ab.

for two types of caesura late and early of which the former of course is more distinct in actual occurrences found in the MB.1 The remaining two fixed syllabic ones noticed by Hopkins are Asambhādhā² and the long Śārdulavikrīdita only in the MB in regular stanzas. The two Ardhasama metres that have fallen into notices of Hopkins are Aparavaktra and Puspitāgrā which may be apparent as fixed syllabic restoration of Vaitālīya and Aupacchandasika, the morā metres. Hopkins finds with the even pada of Puspitagra the rhythm of the Tristubh while Jacobi traces its development from the pure mäträcchandas Aupacchandasika which in turn appears to have Vedic origin.5 A wonderful combination of Vaitālīya and Puspitāgrā in the Rāmā. VII. 86, exhibits a fine specimen of the integration of syllabic and moric principle. There is not a single case of pure Vaitallya. Neither there can be found a single Aupacchandasika stanza. What we have at the end of chapter the Upajāti of Aparavaktra and Puspitagra in odd and even pada of respective metres which are the recast of the odd pada of Vaitālīya and even pāda of Aupacchandasika. 6 And there are ample instances where Aparavaktra and Puspitagra remain in pell-mell condition. Besides, there are type verses

which according to Hopkins are the irregular morā metres.³ Also in the MB. XII one can meet with stanzas which posed to be of Mātrāsamakam type.⁴ Finally we may refer to the appearance of Aryā stanza⁵ in Hopkins' metrical chart, but the very authenticity of these verses are open to doubts because of their non-existence in the BORI edition.

Preceding dissertation is large enough to have a comprehensive but court and concise picture of the metrical practice of the great Epics. Considering the gulf of period over which the growth of the Epic has been taken place, we could not but imagine that the Epic had to confront both the streams of Brahmanism and non-Brahmanism, i. e., Buddhism and Jainism. That is why in the moulding of this vast literature, the impressions of the passers by have been left on the facial construction. Vaitālīya from the Jaina canonical works, gradual emergence of the fixed syllabic metre from the Vedic verses, had their places in this great body.

Over and above, great liberty has been taken by the reciters and rhapsodist. Intrusions were allowed freely. It is for this reason that the epic verses in Mahābhāṣya are freer than those of the MB from which they are taken. The latter however secured its present position after having endured the fret and friction of the pedantic versifiere, whereas the former was fixed in their part as example of grammar.

VII. CLASSICAL LITERATURE

The contemporaneous existence of the heterogenous literature which we have already discussed in the foregoing passages made some scholars to believe that Skt literature being the last train of the Brahmanic cult ceased to live for the time being during the period of closing of the Vedic age and the dawn of the classic.

But the literary evidences consisting of quotations and references found in such authoritative works as the Mahabhāşya go in favour of the contention that there existed in the remote age of Bhāşyakāra a flourishing literature in which even the Skt metres have got a stereotyped form when non-classical literature was in full swing. These also are undeniable proofs that go to establish the fact that there had never been a cessation partial or whole of the continuous flow or rhythmical development that was current at the time of the 'Vedas and had a continuous flow during what is known as the classical period. There are about two hundred and sixty verses including quotations in which from classical syllabic metres to Ganacchandas like Aryā can be found to be employed. Besides, Vaktra and some irregular Tristubh² we meet with some ornate metres also like Vidyunmālā,3 Samānī,4 Jagatī like Dodhaka, Varhšastha, Totaka and also one irregular Jagati. Incidentally mention may be made to an interesting fact that one fragment of

Jagati bears a specimen that is absent in Pingala but recognised in Halavudha's section on Gatha. Ksemendra noted this line and ascribed it to Kumāra Dāsa. In the period following it, no works in classical Skt could be found except some works from Mahayana Buddhists like Asvaghosa and others about whose metrical peculiarities we have said hefore.

After Aśvaghosa. Bhāsa's dramas are to be taken as complete works in classical Skt. Verses occurring in them. may be classed under several groups. The first group deserves special mention. It consists of twentyfour² and twentyseven³ syllabled Dandakas former of which is the type that can be met with in Bharata's Nāţyaśāstra4 with the designation Meghamālā. Next to these, the metre Suvadanā deserves special mention which Asvaghosa employed in his Kāvyas and Dramas. 5 It has its occurrences four times in Bhāsa's works.6 Suvadanā disappeared from the available known works except the solitary appearance in Varāhamihira's work and Sragdharā seems to occupy its place permanently. In Bhasa's works there existed eight Sragdharās which are not only a favourite metre of the Bhuddhists but also of the Dramatists.8 Bhasa used

^{.1.} Gangādāsa ascribes it to Bhāravi in some mss. I.3.48 "Varatanu sampravadanti kukkuṭaḥ". Kielhorn's edition P. 28. Noteworthy is the fact that the same can be found in ujjvaladatta's comm. on Unādisūtra (1.82). Varāhamihira appropriates it in Brhatsamhitā, CIV.14.

very few Aryas in comparison to Kalidasa and Sudraka. We have only eleven Aryas in the whole range of dramas of Bhāsa.1

Out of the total number of 1092 verses employed in Bhāsa's dramas there are 436 verses composed of Śloka metre. As to the structure of them, it shows classical preference that seems to be popular during the period 1st cent B.C. and 4th cent A.D. Complete absence of the 4th Vipula, comparative rarity of the second variety of the same and the high preponderance of the first are all the characteristic features in Bhasa's ślokas. Unlike Buddhist works Bhasa lends favour to the third Vipula. 2 Among the thirteen Pkt verses all excepting one are written in familiar metres like Āryā, Upagīti, Upajāti, Vamsastha and Vaitālīya. The exceptional case has been referred to by Sukanthakar as a piece of Rhythmic prose. But it is in reality a melodious rhymed Pkt metre incorporated in the manual of Virahānka.4 Besides, the restricted use of matra. vittas in Vikromorvasīyam and Ratnāvalī, the use of Upadohaka type of verse in Bhasa proves that except the solitary case of Asvaghosa Skt dramatists used Pkt metres. even in the early ages of Christian era.

It is also a noteworthy feature of the Skt dramas after Bhasa that they in their Pkt portions of the verse composition tried to retain the characteristic features of Pkt metres. Even in the early centuries of the dramatist Sudraka we find beautiful Pkt rhymed mātrā metres used in his drama Mrcchakatika. In Act I we meet with the stanza with fourteen mātrās in each pāda.3 The conservative commentator Prithidhara tried to group it among much recognised Mātrāsamaka chandas. In Act II we meet with another rhymed metre in Pkt having been designated by the commentator as Citrajāti. 1 Another Pkt metre seemed to be lame Upajāti of Suvadanā and Sragdharā. which appears only in the pada C. This has been designated by commentator as Atidhrti Jāti.2 Beside the syllabic metres such as Śārdulavikrīdita, Vasantatilakam, Vaisvadevī and Indravajrā enshrined in both Skt and Pkt. one can have verse with the Vedic rhythms of Tristubh and Jagatī. It has been described as Sūktam.3 Kālidāsa, who has been credited to be the author of a number of Skt works comprising Kāvyas, Khandakāvyas and Dramas, selected both Skt syllabic metres and moric Pkt metres. Some peculiarities found in the use of the Skt metres show his skill and superb sense of versification. His. employment of the Mandākrāntā metre is regarded as the

most appropriate that suits the vein of the theme of his Khandakāvya Meghadūtam. Besides, Kālidāsa seemed to be the second to use Manjubhasini metre which appeared in Bharata's Dhruvā chapter² and in Varāhamihira's Brhajiātakam.3 But neither Piùgala nor Jayadeva corporated it to their respective manuals.

As for the Pkt verses, Kālidāsa is more exponent in handling both Skt and Pkt metres. In Malavikagnimitra. the solitary Pkt verse that we met is the music metre with twenty-four syllabic instants in each pada of quadruped stanza.4 Bollensen in his edition pointed it out as the Pkt song metre employed by Kālidāsa. Side by side, Sakuntalā proved to be conservative in type and all the Pkt stanzas are enshrined either in Aryā or in Vaitālīya form. Intentionally Kālidāsa adopts a Vedic rhythm which he declared as Rkcchandas⁵ which P. G. Ayer describes as Kālidāsa's conscious archaism.6

Vikramorvasīyam of Kālidāsa made a grand hit in including thirty-two Pkt stanzas in order to depict different sentiments through the occasional gust of outbursts directly or indirectly. The metres detected in these Pkt stanzas and one Skt stanza, are all Pkt and Apabhramsa metres incorporated in the manual of much known Svayambhū and Hemacandra.

Now whether these belonged originally to the drama is a matter of dispute. These Pkt stanzas by their position appeared to be Dhruva songs which in NS' are syllabic by

nature. Besides, some of the Skt stanzas¹ disclose an indulgence to verbal pun whereas the corresponding pratyukti in Pkt languages are more or less devoid of verbal embellishments. One would find further inconsistency in proving these Pkt stanzas as Dhruvā songs which have been presented as moric metre which on the contary, in NS' are syllabic. It seems to be somewhat inconsistent for Kālidāsa to disobey the metrical rules of Bharata whose greatness be acknowledged in many places in his dramas.²

This drama has come down to us in two recensions. One preserved in Bengali and Devanāgarī Mss. and commented on by Koņeśvara and by Ranganātha of 1656 A. D. The other is in S. I. Mss. commented on by Kātyayavema, Minister of Raddi Prince Kumāra Giri of Kanda Vidu about 1400 A. D. Most important among other differences is the inclusion of Pkt verses in the IVth Act of the drama of the N. Recension whereas S. Recension totally omits it.

Doubts have been entertained for long on various grounds as to whether the Pkt songs belonged originally to-the drama.

Against the genuineness of those stanzas, foilowing grounds have been sustained:

- 1) Much developed Apabhramsa at the time of Kālidāsa. is more than dubious. 8
- 2) Discrepancy between the apabhramsa of the verses. and that of the proses. 4

Nos. 21, 37, 46, 51 of IV Ch. Vikramorvasīyam — Pp. 70, 76, 79, 81; Velankar ed. It may be due to the fact that these Pkt verses were composed first then supplemented by more ornamental in Skt. Vide, Vikramorvasīyam — Introduction, LXI, ibid, idem.

^{3.} Jacobi — Bhavisatta kahā; Bloch — Vararuci and Hemcandra. P. 15.

^{4.} Keith. H. S. P. 58. P.151.

3) Absence of such a type of verses in the similar types of the scenes. (Mālatimādhava, Act IX, Bālarāmāyaṇa, Act V; Prasanna Rāghava, Act VI and Mahānāṭakam, Act IV).

According to K.H. Dhruvā, the interpolation of the stanzas have been taken place in the age of Rāmacandra. Most noteworthy fact in favour of this argument is that all the available commentators are posterior to this assumed age.

Abhinavagupta did not recognize these verses as genuine. If he did, he would perhaps utilize them while commenting on the Dhruvā chapters in Nāṭyaśāstra. But he made mention of Mālavikā and Ratnāvalī in this very chapter and referred to Vikramorvaśī while commenting on Nāndī.

Dr. Sen is somewhat silent¹ about the authenticity of these verses.

Supporting the views of Pischel² and Konow³ however not very strongly, but somewhat indifferently, late S. P. Bhattacharya and H. D. Velankar accepted them to belong to the original parts.

The inscriptional records found in the time of Guhasena (559—569) — "Samskīta — Prākīta apabhramśa bhāṣātraya pratibaddha prabandha racanā nipuņatarataḥ karaṇaḥ"— give an indication of the existence of the Apa., literary composition even in the 6th century A.D. (Rudrata by the term 'pravandha' means to say—poems, stories and novels). Yet we cannot put any conclusive opinion until and unless we come across any fresh evidence to strengthen the view of either group.

As regards the names used in the stage directions, we find

Bhāṣār Itivṛtta. P. 100 ed. 1960.

Who has brought out a recent compilation of the Apa. stanza (Materialen zur kentniss des Apa. Stanzas, Berlin, 1902. W.N.F. BD.5. Nr.4.

GGA 1894. 475, f. vide, S.P. Bhattācārya. Our heritage. Vol. VII. P.II.

that the Khandaka is a mixture of Khanda and Khandita of Hemacandra. The Khandadhārā is either a Khanda or a Khanditā. The Galitaka is identical with Virahānka's Chittaka. In addition, it is also a noteworthy fact that the Pkt stanzas containing Āryā metre do not comply with classical regulations, i. e., not following the gana system. The whole of the stanzas appears to have been determined by the total count of mātrā and caesura makes them conforming to the Vipulā type. From the manner of presentation of these Pkt stanzas it appears that they are meant to be the Dhruvā stanzas, though the metres employed are entirely at variance with the Dhruvā metres sanctioned by NS.

Dhruvā stanzas in extant dramas other than those of Kālidāsa are composed in Gāthā and syllabic metres. Ratnāvalī of Śrī Harşa has been described to be staged, in Kuṭṭanīmtta of Dāmodaragupta. There the author points out some of the verses as Dhruvās. Of these, two are written in Gāthā metre and one in Śārdulavikrīḍita metre. But the only Pkt stanza of strophic type known as Dvipadīkhaṇḍa² however neither has been described by Dāmodaragupta as Dhruvā nor has been appropriated in NS in its chapter on Dhruvā songs. Pingala made provision for long metres like Daṇḍaka but

^{1.} These verses have been described as Dhruvā songs by Dāmodara-gupta in Kuţṭanīmāta.

[&]quot;Pravešikyā dhruvayā dvipadī grahanāntare' visat sūtri". Kuttanīmāta verse 88, ed. 1961, Varanasi.

[&]quot;Pravešikyāvasane dvipadigrahānantare 'visat Sutrī" V. 801. Ibid. Idem. "Niscakrame grihinyasārdham nihsarangitena" V.884, Ibid, Idem. This Dhruvā is no other than the verse — "Dvipadānyā...etc. enshrined in Gāthā metre.

[&]quot;Kramabhidhāya citraiscaraṇanyāsaiḥ parikramam kṛtvā niskramikyā dhruvayā viniyayau nayako'pi Saha Sarvaiḥ — V. 928. These are at the end of the 1st Act containing Gāthā and Śārdulavikridita metre.

^{2.} Ratnāvalī Act I. Verses, 14,15,16. Bombay N.S. Press, 1890.

never has prescribed any abbreviated form of it. But Halāyudha noticing the use of them in the works of Bhāsa¹ and Kālidāsa, incorporated one such form of the metre with the designation Mahāmālikā.²

Bhavabhūti employed the metre Narkuṭaka in his drama Mālatimādhava³ and Kumāradāsa also used⁴ it. The same one appeared in Sivaswāmin's⁵ Kappinabhyudaya and in Viranandin's⁶ Candrapravācaritam. This very type had not been recognised by Pingala but Jayadeva⁷ incorporated it and Varāhamihira used in both his works.⁸

Mudrārākṣasa of Viśākhadatta is worth noting here for the use of Aryā with amphibrachys in the odd pāda even at a time not earlier than the 7th century.⁹

Bhavabhūti was truely a conservative Brahmin by manner and by caste. It makes him particular about the use of

Telang's ed: Lagge Hohi Sulagge somammi Gahammi Jai bi dulagge Vahesi Diham siddhim candassa valena Gacchante. Hillenbrandt thinks that the dramatist must be contemporar to Hiuen Tsang, consequently in the 7th century. cf. ZDMG. Pp. 130—132.

metre where he did not allow scope for non-Skt metres. One long Dandaka with six shorts and sixteen amphibrachys was in keeping with his mood of depicting seriousness.

A century earlier Varāhamihira in his voluminous work on Astronomy not only employed varied types of syllabic metres but also restricted some chapters¹ for them where he in disguise of explaining movements of planets defined varied types of metres.

Bihajjātakam² embraces short but uncommon metres like those which appear in the verses VI. 3, 4. These have been described by the commentator as Anuştubh. But it is practically a Sarvasama Anuştubh with a scheme SSIISIIS appearing in the manual of Jayakirti. As a derivative of Vidyunmālā³ with the scheme of Bha ma ma which has perhaps come into being through splitting up of the end guru into two shorts, a new specimen appears in both these works. Another kind of it in which 4th and 6th long being splitted into two shorts have been employed in these two works. This very type of Virāja has been appropriated by Bharata and Hemacandra.

Jayak Irti perhaps did not prove himself superfluous in introducing the possible varieties of metres that can be made available by the law of permutation and combination. What Varāhamihira introduced has been corroborated by Jayak Irti. Following specimens are sufficient to show how the practice coincides with the theory:

a)

 Maņi.

In Br. Sam. the metrical scheme Nayasagaga has been employed twice slightly differs from the norm Nayabhagaga which is same in spirit but different in figure from what appeared in consecutive manuals².

Bhadrikā³ has been used only once though it has appeared in the Rāmā. but has not only been recognised by Pingala and Jayadeva with usual designation but also by successive manuals.⁴ In Br. Jā II. 8 there has been employed one Ardhasama Vrtta where the schemes in alternative pada possess rimed designation of the Jagatī form bearing the well-known pattern of Totaka, whereas Tristubh form is a new one which has been described as Motaka in Bhārata and others.⁵

The metre Dhīralalita is first dealt with in Br. Sam, and has been appropriated in Vjs. and Hem.⁶ A fair number of Vişamavrttam⁷ except Udgātā which have been employed by Varāhamihira, cannot be found elsewhere.

In chapters prescribed for metrical analysis, the same astrologer had shown uncommon skill in handling long metre like Dandakas with unusual length and of varied types.

In Bhattikāvyam, we have perhaps the earliest use of short metre like Tanumadhyā2 which is practically absent in all the extant works of Skt literature. The author of this Kāyya was perhaps the only writer to use "ISI (Ja) gana" in odd pada in the Āryā metre. Besides, there have been used two syllabic metres comprising a scheme bha bha raya4 only recognised by Canarese prosodian Nagavarmans of the 10th century, who codified it with the designation Hamsapramatta, other being appropriated by Chandomañiarī.6

Bhāravi in his Kirātārjunīya employed only once Madhyakṣāmā7 corporated by Halāyudha in Gāthā section.8

After Aśvaghosa, Bhāravi is the foremost to employ Udgātā metre for continued narration.9 He is followed by Māgha in whose Kāvya more than hundred stanzas have been used in this metre. 10 Utsara 11 appropriated in the manuals12 not earlier than the 10th century A.D. appeared in this Kāvya. Though rare in most extant Kāvya works,

Ratnākara employed this specimen in his Kāvya. Like Māgha Ratnākara too used a new rhythm known as Siddhi² in the manual of Svayambhū³ which is more current in the South as can be proved by the verses appearing in inscriptions. 4

The credit will be ascribed to Magha for the use of as well as giving designation to the metre Atisayini as it appears in the same form and figure in the subsequent manuals. Kutaja having the scheme sajasasaga has been taken for granted by the Southern prosodist.7 No wonder that Lalambiraia of the 11th century being patronized by the Southern king would have a fancy for it as we find such as one in his Kāvya Harivilāsa.8 Māgha has been credited with the honour of creating new rhythm such as Manjaris employed by Ratnākara 10 and Sivaswāmin 11 which has been codified by Jayakīrti and Vrttaratnākara. Šivaswāmin has surely an access to Mahākāvya of contemporar Ratnākara because the metre with the scheme 'mabhanayaga' appeared both in Haravijaya¹² and Kappinabhyudaya. Vagvallabha retained it in the body under the designation of Prajñamula because it has got its origin in the works of Prajña. or wisedom. 18 In the same way it can be presumed that Siva-

swämin¹ restores the rare but new specimen Pramadā having the scheme najabhajalaga experimented by Māgha.2 Vāninī³, a new metre appeared in the work of Ratnākara⁴ and Sivaswāmin.5 And the extended form of it employed by Magha having a scheme najabhajajara is one of the unknown metres employed by Ratnākara who flourished one century later. Ratnākara supplied us with a series of . specimens of the rhythm used in the metre 'Siddhi' having the scheme najabhajajalaga first employed by Māgha in canto IV. These have been appropriated by the manual of the 1st century and some of them have been appropriated by Śivaswāmin in his Kappinabhudaya. Ratnākara's® another new experiment appears in the manual of Svayambhū³ under the designation Nandlmukhl. Besides, there are other new derivatives 10 experimented by Ratnakara. which however did not get any place in subsequent manuals on Skt metrics.

Dhanañiava in his Dvisandhana Kavya¹¹ employed more than three times the metre Kudmaladanti12 which Javadeva

codified under the name 'SrI" but Pingala omitted. Subsequently Halāyudha, a contemporary with the poet, however, preserves it in the Gāthā section. We may close our survey on the use of metrical specimens in the extant Kāvya literature assigned to a period not later than 10th cent. A.D. by mentioning the name of Viranandin of the 10th century A.D. who employed Candrikā¹ only once in his Kāvya Candraprabhā Caritam which is not to be found in the extant literature. It is preferable to omit from the purview of this thesis those works that use in a hackneyed manner all the well-known metres and exhibit no capacity in handling properly the syllabic metres. There are more than twenty such works and by ignoring them we shall not be losing anything but the names to multiply the list.

The metre Ekarūpam² appearing in Haricandra's Dharmasarmabhyudaya can neither be found in extant Kāvyas nor has it been incorporated in any manual. Such a type of the Tristubh class has been included by Yādavaprakāsa in his commentary on the Chandaḥsūtra of Pingala. Halāyudha seems to ignore it, because he has neither made any comment on it nor included it in the Gāthā section. It is curious to note here that this particular metre used by Haricandra in his Kāvya can be found in some of the mss. of Pingala Chandaḥsūtra.³

This dissertation cannot be completed if the dramatic literature after Kālidāsa belonging to the period under review is left out of its purview. Because, Skt dramas contain the age-old convention and considerable number of verses composed of a variety of languages that are incorporated in them with a view to suiting the character, situa-

tion, temperament and the sentiments tackled by them. We are to note here some of the much known works of the dramatists like Bhattanārāyaŋa, Rājašekhara and the like. Bhattanārāyaŋa is the most successful dramatist to appropriate suitable metres for depicting different sentiments. Among these we can find a Pkt Vaitālīya² where the total count of morā has been retained but not the syllabic arrangement.

Bālarāmāyaṇa of Rājaśekhara comprises nearly seven-hundred eighty verses of which more than two hundred are in the long Śārdulavikrīdita and about ninety in the long Sragdharā. Among this rally of syllabic metres, the poet dramatist displays his knowledge on Pkt in employing Dohā³, the favourite metre of the Apabhraṃśa poets and some Pkt Gāthās with their total number of mātrās distributed suitably over the four parts of the stanzas.¹ In his drama Karpuramañjarī,² Rājaśekhara employed mostly syllabic metre excepting two verses appearing in 29 and 30. Of these the former belongs to Catuṣpadī type of Mātrāvṛtta having 8 mātrās³ whereas the latter is well-known Ghattā of Apabhraṃśa metre.⁴ Sometimes, the jovial prakritic mood inspired the dramatist to use rime even in the syllabic

metres. 5

It is not unnatural that Sandhyākaranandin, the Bengalee poet in the 11th century has not been so rigid in preservation of the Sastric rule in the composition of Aryā in his work Rāmacaritam⁶ where in a number of cases he violated the gana system. In his two hundred and twenty Āryā werses we have not less than four verses where instead of gana system total count of mātrās have been restored.⁷

We should not set aside the case of polymath Ksemendra who flourished in the 11th century in Kashmir. His close acquaintance with the poets of other provinces of India can be guessed from the use of Apabhramsa song written in a manner which is much akin to the devotional lyrics of Bengalee poets. The specimens culled from Dasāvatāracaritam will show that they are the very type of Apabhramsa verses with rimed feet which Hemacandra recognised as Upajāti, a variety of Apabhramsa satpadī metre.

Almost in the same century, in the drama Chandakauśīka of Kṣemīśvara² we find nothing distinctive in the use of metres. Like Kālidāsa he had inserted a verse with Vedic rhythm and also a verse with an Upajāti of Vamśastha and Indravajrā. Among the mass of syllabic metres and a number

of Aryā of classical Skt, there has been employed one Pkt stanza in Vaitālīya rhythm¹ with melodious pādas. In the works of Bilhaṇa,² Padmagupta³ and Halāyudha⁴ nothing novel can be found. Most of the poets upto the 11th century were meticulously conservative in their selection of metres just like the theorist on metrics belonging to the same period. From all intents and purposes Kedārabhaṭṭa's work seems to occupy the position a magnum opus in respect of versification of the contemporary orthodox school of Skt metrics. In the same category we may include the much disputed drama Hanumannāṭakaṃ⁵ which faithfully follows the orthodox tradition of the time with a solitary exception of a half-Āryā verse where gaṇa system has not been maintained.6

In Prabodhacandradaya of Kṛṣṇamiśra on the one hand, the stanzas of both emotional and reflective types have been set in proper metrical arrangement in order to produce the desirable dramatic effect. Placing aside the traditional syllabic metres we are concerned herewith peculiar type of Pkt mātrā metres having the rime scheme repre-

sented as ab—cd.¹ It is very interesting to note here that these new metrical features came to be introduced for the first time by this dramatist and Hemacandra was the first theorist to codify it in his manual.² The 18th verse of the Act III is the stanza of fifteen mātrās with rimed feet abcd. In the 23rd stanza in Brockhause's ed., there is a metre of twentyeight mātrās distributed over 10-8-10, which in NS edition³ has been replaced by a Pkt Gāthā whose four pādas have been distributed with the mātrās 12 and 18 in alternative ones.

From the discussions made above, we are led to the conclusion that the Kāvya belonging to the period in question are mainly orthodox in nature in so far as the selection of particular Skt metres are concerned.

Exceptions, however, are to be found in the solitary case of Ksemendra and the stray references found here and there upto 11th century. Barring these exceptions, the extant Kävya literature did not make any provision for non-Skt. metres.

Non-Skt literature in this period, show more preference for syllabic metres. The employment of single "Galitaka" metre in the PaumaCaria evinces the fact that in the early part of the Christian era, orthodox metre predominated over the non-orthodox ones even in the fields other than Skt.

In dramatic literature, on the other hand, to heighten the dramatic effect non-Skt musical metres received much

favour from the 4th century A.D. onwards. It is however, curious that this particular feature is almost absent in Asvaghosa's drama but in thirteen plays ascribed to Bhasa there is a solitary instance of employing non-Skt musical metre.1

In his voluminous work the Naisadhlyacaritam, Srl Harşa employed the metre of sixteen shorts recognised as mātrā metre in Pingala Ch. Sūtra. 2 But the poet seems to treat this metre as one belonging to the syllabic type and a little earlier Hemacandra³, a senior contemporary with the poet had condified it as an extended form of the Caladhtti.4

Hemacandra in his Dvya śrayakāvya extended his recognition to those metres also which mainly appeared in Buddhist hybrid Skt works-like Lalitavistara and Saddharmapundarika Sutram and enlisted them in his manual. The selection of these specimens for his Kavyas sufficiently illustrates our contention that Hemacandra sets out these examples in his own work obviously for the reason that he wanted to show the parallel development of practice and the theory which he elaborated. The specimens, viz., Mahendravajrā⁵ and Sudantā⁶ are the products of the non-Skt literature appeared both in manual and work. In order to introduce new rhythm, Hemacandra employed Khola, Mṛdanga⁷ in his Kāvya and these are also incorporated in his manual.8 Mankha in the same century made

an experiment to introduce Apabhramsa metre Upadohaka¹ not less than ten times in his Śrłkanthacaritam. For continued narration Udgatā is used here. It is perhaps the last Kāvya to be mentioned where the Viṣamavṛttam has been used for continued narration. Amaracandra utilized the new metres in his Bālabhārata² appeared in Hemacandra's manual, a century earlier to him These new are Utthāpanī³ and Lalita.⁴ Bālacandrasūrī in his Kāvya used purely two Apabhramsa metres among the twenty-five different Skt syllabic metres. These are Mālādhruvaka⁵ and Vidyādharahāsa⁶ appeared in much known manuals in Apabhramsa metres.

Jayadeva, the author of Prasanna Rāghava is to be distinguished from several other Jayadevas known to literary history. He shows more skill in its profuse employment of verbal figures absorbing the newer characteristics of the coming literature. This drama exhibits the lack of dramatic sense being deficient in unity of action and characterisation as a late century production and is more particular about the ornamental stylistic mood of expression. Classical rigidity has been slackened and Skt metres have been introduced in Pkt verses. Rime has been used mostly at the prosodical and the syntactical pauses, and no care

has been devoted not to use Amphibrachy in proper place.1

Here with the selected works upto the 13th century we will close up the mediaeval period. Prosodical elements appeared in the literature of this period command attention, because, they show the general features of shut down point of the age long convention in a much more intensified manner as we can see Skt metre itself has been naturalised with the non-classic feature, unconsciously but slowly. On the side of the theoretical works, this fact furnishes a clear explanation how the works of the late century swell up their limited scope and make provisions for the recognition of the non-orthodox element.

In the 14th century, Umāpatidhara in his Pārijātaharananāṭakam² along with the Skt verses and passages allocated rhymed Maithili verses-which bear however Tālavṛtta specimens according to the manuals of Pkt and Apabhramśa versifiers.3

We should have placed here a text of late century vernacular tinged with Apabhramsa work Sandesa kāsaka by Abdul Rahman. Greater interest of this Kāvya is that it places Skt syllabic metres in Apabhramsa language with

usual rhyme. These are Mālinī, Nandinī and Bhramarā-valī.

As for late century Skt works, we have selected for metrical analysis the following works—Gīta Govinda of Jayadeva, Haricaritam of Caturbhūja, Kāvyas of Paṇḍitrāja Jagannātha and Kāvyavılāsa of Cirañjīva.

Distinctive greatness of GītaGovinda lies in its ability to mould and adopt the easyflowing resonance of the vernaculars. And this has been made so perfect that it had completely overshadowed the true orthodox original character of Skt syllabic arrangement with the intrusion of the rime at middle and at the end to produce the musical effect. They have their origin in the synthesis of later vernacular music in Skt structures. As a mark of transition period like the great confluences, GitaGovinda embraces different streams of traditions that flow through it. Consequently in ten sargas which comprise eighty verses and twentyfour songs, we meet seventyseven syllabic metres, one Āryā and two Apabhramsa metres. Of the first type we have both the orthodox type2 containing the name of the metre in which the verse is written and the type which contains rhyme and refrain.3 As for moric metres we

have the specimens of Dvipadi, Catuspadi and Şaipadi. As for Dvipadi there are both sama and visama type.

In Samamātric chandas—there are three types of metres—one containing twentyeight mātrās in each hemistich¹; the second having twentyfour mātrās; the third one containing fifteen² mātrās distributed over 4-4-4-3; 3-5-5-2; 4-4-5-2.

Vişamapadī on the other hand, presents two types one having twenty mātrās in first half and sixteen mātrās in second³; and the other containing seventeen and fifteen mātrās in their respective hemistiches. Of Catuşpadī type, we have a specimen, which contains equal number of mātrās in each pada. This belongs to two types: those having eight mātrās each⁴ and those having ten mātrās⁵ each in each pada known as Vijayaka and Ēkāvalī, respectively.

The most important is the metre of the satpadī type, extensively used by Jayadeva. This very type has been utilized by many languages and our Skt Kāvyas also retain some of such specimens as can be evident from the illustrative verses provided by svayambhū⁶ for the said metre while he

defines it. The Şatpadīs of Jayadeva are of Sāra¹ type. This has been defined by Svayambhū,² Hemacandra³ and Nāgavarman. Besides, GītaGovinda contains, the verses of Kusuma Şatpadī type having 10 mātrās in 1st, 2nd, 4th and 5th and 17th mātrās in 3rd and 6th.⁴

In Kannāda, there has been one type Vardhaka Şatpadī which consists of 4 mātric ganas. In this metre 3rd pāda has been splitted into 3rd and 4th, where the deficit mātrās of the 4th has been patched up by refrain of two mātrās. This type is identical with the prevailing measure of the famous ottam Tullal poems in Malayalam. That is why in Malayalam, this is known as Aṣṭapadī and it is their common belief that this has been inherited from Gīta Govinda. Nevertheless they are in reality Ṣaṭpadīs. 6

Caturbhūja⁷ had pioneered in a venture in rhymed verse composition in Skt kāvya not meant for stotras which has been treated separately in subsequent section of this thesis. Metres used in Haricaritam are all varņa Vṛttas. But some of them have been decorated with ornamental inter rhyme in place of caesura, especially in the metre.

Vadasi yadi kificidapi / dantarūci kaumudi / harati haratimiyamati ghoram / Sphuradadhara Śidhave tava vadana candramā / rocayatu locana cakāra // II. X. 2.

Mālinī, sometimes in the Prthvī metre, in Rucirā and in Lolā. Sometimes the verse has been equipped with Yamaka. Karavālinī a new rhythm as has been designated by the author has been only appropriated by Hemacandra under the designation of Vānini. So is the Gīrika a new rhythm incorporated by Pkt Paingalam.

Most outstanding feature that deserves special mention, that the great rhetorician Jagunātha did venture to use Amphibrachic in odd ganas of Āryās, though he employed Skt syllabic metres in his stotras. In one of his composed pieces, we came across mārrā metres known as Ghattā having twelve mātrās in each foot of the quadruped stanza.

Before we conclude our brief survey on the prosodical practices of the Skt authors with the works of a poet prosodist Cirañjīva Śarmā of the 13th century, we should refer to now his versatile scholarship enables him to adopt some vernacular metres, such as Kavittha, Saveyā which in the brief exposition on Skt metre of the same author has been appropriated. These favourite metres of Hindi poets Tulasīdāsa¹⁰ and Priyādāsa had been employed profusely.

In Kāvyavilāsa¹ Cirañjīva also used Durlatika an extended form of Toţaka which has been recognised by Prākrit Paingalam² and Mandāra Maranda Campū.⁸

If we make a short note on the literature of Skt cultivated in Gujrat especially in the mediaeval age, we would not be extravagant in our treatment of preparing a survey of prosodical practice.

Gujrat has made a notable contribution to Skt literature by its assiduous composition of Phāgu pravandhas in Skt. The vernacular metres used in these compositions have been formulated as Phāgu metres like Virūda in Gaudīya Vaisņava Vairūda Kāvyas.

As a first Skt Phāgu we can refer to the Mahavīrastavana of Jayasundara Sūrī of the 15th century in its printed form. The Phāgustava of Gujrat poets present a novel artistic composition by its superbly mellifluous metrical pattern of the Phāgu for its religious panegyrics. Thus we have Skt stanzas with Phāgus (Doha 13-11 metres with internal rhyme), Aḍhaiya (11-11; 10-10) interchanged with Skt Varņa metres and closed with Gītika metres. No less remarkable is the drama by Gaṅgādhara, the Gaṅgādāsapratāpavilāsa where the said dramatist employed rime in the rigid orthodox syllabic Skt metres. The work concerned is to be dated 1449 A.D. because, it describes the battle between Muhammed II of Ahmedabad and King Gaṅgādāsa under whose patronage the poet wrote his drama.

The storehouse of Indian hymnology is so rich that apart from religious significance it deserves deeper investigation for its literary worth. And it can be said, that no other verse of Skt literature has been so prolific and diverse and we would have to be blamed for incompleteness if we keep aside them as mere literary curios, even if they find no adequate place in rhetorical and anthological literature. Stotra literature of the early age illustrates the application of the elegant type of Kavyas. Along with the effective alliteration and Yamaka the flowing gorgeousness of the sonorous Sardulavikridital and Srag--dharā² are the best appropriate metres that suited to the vein of the theme that they contain. Besides them, Sikharinī. Vasantatilakam and Ardhasama Catuşpadī metres like Vivogin13 are the most favourite metres selected for the hymns irrespective of religious sects. Arya4 and Paiihatikā have also been appropriated from time to time.

The later history of stotra literature presents two lines

SKUTASKTE TANKER OF

of 'developments, on the one hand we have the continuation of earlier tradition and on the other, there grows a series. of mediaeval devotional stotra which marks a departure from traditional reflective ones and is characterised by erotic devotional sentiments which express the religious longings. in properly set languages and imagery of earthly passion. In orthodox classical syllabic metres, the middle and end rhymes have been employed in order to introduce a pleasing variation and to produce a swinging sweetness that can extol the mind. The emotional type of stotras, Virudas. Giris and Kavyas present a new literary form for direct popular appeal, consequently sensuous, erotic, imaginable and expressive shaped and coloured by fervent religious emotion. Consequently, mellifluous music in Matravrtta. is called for in order to be collaborated with the changing mood of theme. In this section orthodox syllabic metrespossess the taint of vernacular poetry having rhyme on the sense pause and end pause.

Kavi Karņapūra possessed indeed sufficient metrical felicity that has been focussed in all his works. His Caitanya-Caritāmīta¹ is just like a classical orthodox Kāvya in which poet employed metre in a manner of quite conventional type of employing a single metre for each canto with a break of an other at the close. Whereas Kṛṣṇanikakaumudī has² been credited to have seven hundred and five rhymed syllabic metres distributed in five Prakāśas. First of them is to contain Mālinī metres with (Madhyāntānuprāsa) rhyme.³ The second, third,

fourth, fifth and the last, are written in Vasantatilakam, in Śārdūlavikrīḍita, in Svāgatā, in Puṣpitāgrā and in Mandākrāntā respectively with the end rhyme. Likewise, Raghunāthadāsa employed a variety of syllabic metres in his "Stavāvalī" among which Sikhariņī and Mālinī have more frequent use. In any one of them one cannot find any remarkable feature whereas Rūpagoswāmī left piece without being ornamented with rhyme. 8 Virudas, Gitas and Astakas are the literary exercises of great ingenuity which marks a departure from the elevated tradition. The spring and the resonance of the verses and the swing and the smoothness of the comparatively facile diction transcends the formalism of literary and emotional trivialities. Only a few works have been selected and have been introduced here to present their extraordinary metrical harmony with prodigality of verbal dexterity. They are Mukundamuktāvalī⁴, Svayamutprekşitalīlā, Govindavirū. davali. Astadasacchandas and the fine collection of songs in moric metres entitled Gītāvalī, which is a collection

of forty-two songs in Mäträcchandas dealing with themes. of popular appeal. The metres dealt with are generally Tribhangi and Caturmatrika Parvacchandas.1 Of the thirty rhymed, alternative stanzas of Mukundamuktāvalī. eight have moric Pajjhatikā, four in Mālinī, others in varied lyrical measures like Citrā, Jaladdhatogati. Tvaritagati, Sragvini and Tunaka with an execution of fine adjustment of sound effect. 2 Svayamutprekşitalīlā. experiences the same method in its thirty rhymed and alliterative stanzas. Without multiplying examples, we would pick up here the rare matras and one common Bhujangaprayāta which will perhaps serve our purpose. Virūdakāvyas of Gaudīya Vaisņavas make an attempt to evolve a novel device with rhyming alliterative metrical unit based on the classical gana in the field of prosodical science which has been appropriated by Vrttamauktikam, about which we made discussion. It is strikingly original in its structural design of having metrical feet or pada desig-

nated as Kalikā measured by number of Kalās corresponding to mātrās or syllabic instants. Govindavirūdāvalī is an ambitious literary feat deliberately composed to illustrate varied types of Virūda metres, which have been accorded place to Vittamauktikam.

Astakas are the hymns comprising a collection of metrical stanzas. More sober is the stanza taken from Sitārāmstaka¹ with a rare combination of seven "bha" (SII) and twoga (SS) designated as Mayuragati.

Astadasacchandas experiences eighteen cchandas or rhythmic prose or verse. Many among them such as Asokapuspamañjarī, Ananga Sekhara, Mattamātanga belong to Dandaka class of metre. Gucchaka² is a new device experimented by Rūpagoswāmī; Anukul³ is a fourfooted rhymed metre of fifteen mātrās.

Harikusumastava and Tribhangapancaka are of the character of Aştaka. The former consists of eleven Totaka stanzas and the latter comprising five rhymed moric stanzas. of thirtytwo mātrās known as Tribhangī.4

Without going into unnecessary details we should close our discussion by placing some late century stotra works-Maņikarņikās totra, Annapūrņā stotra and Yamunāsţaka stotra ascribed to Vedāntācārya Śankarācārya.1

Most of them are written in rhymed classical metres. Carpatapañjarīkā stotra is on the other hand composed in elegant moric metres of quadruped type. Now-a-days all of these claimed to be the works of Sankarācārya who flourished in the 8th and the 9th century A. D. But there lies little parity between these and the eight sargas which can be claimed to be composed by Sankarācārya as they have been commented upon by more than one reliable and ancient commentators.2 The metres of last mentioned sargas are regular unrhymed classical metres whereas in the pre-mentioned sargas and in other works elegant rhymed Pkt metres are used along with interrhymed syllabic metres. Besides these, we also have at our disposal numerous Padāvalīs ascribed to Vāsudevasārbabhauma, which betray a curious knowledge on Skt language and

SANSKRIT AND PRAKRIT METRICS: THEIR INTERRELATION

I. INFLUENCE OF SANSKRIT METRE ON PRAKRIT METRE AND ITS DIFFERENT OFESHOOTS

Introduction:

188

What is meant by Pkt? What is Pkt metre and what is Skt metre? Mātrā as a metrical unit; Influence of Skt metre on Pkt metre—in the early stage—in the middle stage—in the later stage; Influence of Pkt metre on Skt metre through the stages.

Nātyašāstra of Bharata is perhaps the earliest work to mention the different kinds of Pkt. The word Pkt seems to be used as a generic term for the middle Indo-Aryan languages. In the NS' Pkt has been divided into seven Bhāṣās or major dialects and six Vibhāṣās or minor dialects.¹ Prākṛta-lakṣaŋa of Canda names four dialects - Prākṛta. Apabhramsas, Māgadhī and Saurasenī. Hoernle thinks that the Pkt'referred to by Canda is the Ārṣa Pkt which is the language of the Jaina canonical works.²

Most of the poeticists are in a mood to describe the Pkt speeches as genre for all provincial languages. Dandin contends that—Skt is divine whereas Pkt having three principal varieties as an earthly language belonging to common people.³

Rājašekhara (c. 1000 A.D) in his Kāvyamīmāmsā1

recognised four kinds of Pkt speeches-Pkt Apabhramsa, Paisaci and Magadhi.

Lakşmīdhara, the author of Sadbhāsācandrikā laid down Bhāṣā dvidhā Saṃskṛta ca Prakṛti ceti bhedatah Prākṛtah Samskrtayastu Vikītih Prākīta matā.

The first hemistich occurs also in the Nataka paribhāṣā or Śingabhūpāla (1330 A.D)

Prākīta candrikā enumerates six kinds of Pkt dialects in which Apabhramsa too has been mentioned.2

In one of the verses of the Garuda Puranam³ brahmins are not allowed to study Prākrit dialects of the Mlecchas. And MM. H. P. Sastri pointed out that most probably thisterm implies the language of Buddhism and Jainism. It is interesting to note that Buddha is said to have despised the use of Skt.4

In the Rāmāyaņa, the work "Prākṛta" in the compound word 'Prākṛta nara' denotes common man.8

From the discussions made above we are preforce driven to the conclusion that broadly speaking the word 'Prākṛta' has been used by the ancient and medieval writers to denote the language of the common people which is quite different from Sanskrit.

Now another question arises how and when the Pkt came into existence?

The widely accepted definition of Pkt is 'Prakṛtyāḥ Agata Prākīta. Prakītih Samskītam' which means to say that Pkt language is nothing but the lineal descendant of Skt. Skt is. 'prakṛtiḥ' or source and the Pkt is derived from it and

^{4. 11. 108.2; 52.16;} Ram.

obviously it is differentiated from the source by several stages of evolution.

The traditional contention is however open to certain objections as it covers only those forms of Pkt which are used in Skt plays and Jaina literature but excludes from its sphere Pāli, the dialects found in Jaina inscriptions and coin legends.

Even Pischel's¹ famous 'Grammatik' would have to restrict its scope in an analytic study of dialects as they could not fulfil the conditions of this orthodox definition.

Namisādhu, the commentator of Rudrata's Kāvyālamkāra, laid down the most appropriate modern definition of the word 'Prakīta',—the basis or the Prakīti. In other words the term Prākīt owes its origin to natural language of people uncontrolled by Śāstras.

The term Praktti also signifies subjects³ or common people.

Bhandarkar sticks to the orthodox traditions and thinks that Pkt is to be derived from Skt⁴ and this Skt was perhaps corrupted.

Professor Weber however did not admit the fact that Pkt was the decendant of Skt but believed that Skt and Pkt had common and simultaneous flow.

MM. Vidhusekhara Śāstrī has faith in this contention and adds that both Skt and Pkt owe their existence to the subsequent development of the Vedic language from which two streams of these sister languages originated and flowed down to us. In the scholarly and lucid exposition of

^{4.} JBBRAS XVI. P. 268.

^{5.} Vide. Pāli Prakāśa—Vidhusekhara Bhattācārya P. 28.

Anirvana, we find side by side the existence of Pkt and literary languages in the Vedic period. This Pkt is nothing but the language of the common people.

Mr. Beams contends that originally Skt and Pkt were contemporaneous in their development; Pkt came into being in course of natural development of the primitive language while Brahmins are responsible for creating Skt.²

Dr. Sen³ believes that Pkt originated in different stages from spoken language of which the first stage is Pāli, the second stage is Pkt, the third one is represented by Apabhramsa and its later phase called new Indo-Aryan is represented by the Vernacular.

In ordinary Hindu usage the term Pkt is extended toall vernaculars, i. e., Mārāthi, Gujrāti, and various other idioms current in northern India.

Historically the fact appears to be something like this. In the later stages of its development the Vedic language deviated from its old standard due to various reasons and there were various phonetic, syntactical and other changes which were distinctly noticeable among the common people who were obviously unsophisticated. Naturally the elite of the society got alarmed for obvious reasons and a norm was perhaps laid down in the grammatical treatises on the basis

^{2.} Referred to by Bhandarkar, P. 322. JBBRAS. XVI. of Namisādhu— Rudrata's Kāvyālamkāra Ataeva samskrta prākrtamādau nirddişiham ladanu sam krtādini Pāninyādi vyākaranoditasaba lakşmanena samskaranāt samskrtam, Ucyate.—Bhāşya on 12 //2.

^{3.} History of Bengali literature P. 3.

of the languages of the elite or Sistas. This language of this Sista class in course of time came to be known as the refined or Samskita, while the language of the common folk remained as the language of the commoners or Prakita. 'Na' prabhāsita vai, na mlecchitavai. etc, cited in the Mahābhāşya unmistakably point to this fact. The bhāşā of Mleccha is the Pkt and assumes different designations in different phases of development.2

Before proceeding to further deliberation, we would first determine, what do we mean by Pkt metre and by Skt metre?

Apparently they are so-called because the vehicle of the particular metrical composition is Skt or Pkt. reality, however the different lies deeper than that.

Two broad divisions of Skt metres into Vrttas and Jatis have been forestailed by Pingala and accepted by later prosodists. Vittas are mainly based on syllabic quantity and Jātis on the mātrās. In Pingala's Chandasūtra we have both kinds of metres. In later manuals both in Skt and Pkt languages we find those two types of metres.

Historically, however, the matra metres are originally the metres of Pkt languages and are sustained by it. Syllabic metres, on the other hand, came into existence through Skt metrical compositions and retained by the doctrinaires. This conclusion become irresistible because of the following data-

Pingala appears to contend that classical Skt metre originated from the Vedic metres.

Virahānka, one of the earliest author of metrics in Pkt languages had chosen to employ different languages in the definitions of different metres indicating thereby the

Mahābhāṣya—P.2. Vol, I. Ed. Kielhorn 1892.

^{2.} See Infra-Footnote 14. A traisthubhacca yadarsam IV // 4. P. Ch. Sūtra. B. I. Bd.

language of the metre to which it originally belongs at least in so far as it was known to him.

In this manual, it can be found, that syllabic metres or Vittas are enshrined in Skt language. The three jāti groups—Gāthā, Vaitālīya and Mātrāsamakam have been totally excluded from the aforesaid portion. The Skt metricians however included the said groups in their metrical scheme but with some restrictions and this fact unmistakably supports the stand taken by Virahānka.

Bhoja Rāja in his Srngāraprakāša while explaining three classes of metres, Vaidika chanda, Ganacchanda and Mātrācchanda laid down example in their respective languages. Bhoja used Pkt language to illustrate mātrāvīttas.

The author of Pkt Paingalam in its introductory stanza while conveying the customary salutation to Pingala, describes him as the anchor of the ship that has crossed the ocean of mātrās. ²

Nanditāḍhya one of the earliest Jaina prosodist declares that he would tell about the definition of the gāthā based on mātrā and would enumerate the nature of the long and short syllable as should be applied in the Pkt Kāvyas.³

Bhāṣyarāja, while making broad divisions of chandas

—Vaidika, Laukika and Vaidika-Laukika, included Aryā in

Laukika group⁴ which is sure to signify popular type.

Our inferences in this respect are generally born out by the fact that both the Skt and the Pkt doctrinaires maintain the view that the Pkt or Laukika literature employ Jāti or metres based on mātrās and the Skt literature originally employ syllabic metres.

Any discussion on the influence of the Pkt on the Skt and vice versa seems to be intenable, unless we keep the following characteristics regarding the Pkt metres always up in our mind:—

- 1) Pkt metres are generally based on matras.
- 2) Orthographic character of syllables are not necessarily maintained in the Pkt as in the Skt metres.
- 3) Rhyme alliteration are the factors mostly counted to be essential in the Pkt but rhyme is not necessary for the Skt metres.
- 4) Caesura is an essential element and classical authorities restricted the use of the same to ganavīttas, whereas the Pkt versifiers attach little importance to this feature.
- 5) Eight syllabic ganas are the innovations of the Sktprosodists, whereas five mātrā ganas have been selected for mātrā metres by the Pkt prosodists for the Pkt metres.¹

Kavidaranam Verse— 2-3.

The influence of the Skt metres on the Pkt ones is discernible through the following processes.

- 1) Appropriation of the Skt metres in the Pkt literature and manuals.
- Imposition of the Skt techniques in the versification of the Pkt prosody.
- 3) Acceptance of the Skt rules and principles as the guiding principles of the Pkt versification.

The most far reaching and deeprooted influences of the Skt prosody on the contemporary the Pkt prosody can be easily guessed from the extensive use of syllabic metre in metrical literature enshrined in Middle Indo-Aryan languages, where the Pkt metres have scarcely any scope to exhibit themselves.

We have already noticed that the vast literature in Pkt in the earliest stage, mostly in form of Buddhist scriptures and Jaina sacred books, have been preserved in syllabic Anusubhi and subsequently in mātrā metres. Gradually, these mātrā metres became regularized in a manner sanctioned by the Skt authorities.

But there are authors who devised different methods for the definition of metres. e.g. Jānāśrayī applied common methods for both types, whereas the techniques of Svayambhū and Virahānka are completely different.

The object of the present dissertation is to study in lines the influence that has been mutually exerted by the Skt and the Pkt prosody on each other.

It is interesting to note that in the works just mentioned, we met with regular Skt ornate metres, like Rathoddatā Rucirā, 1 etc.

Likewise, in the scriptures of the Jainas, we came in contact with partly regulated Vaitālīya, 'Hybrid Vaitālīya'², Triṣṇubhs and Anuṣṭubhs. In their kāvyas there are long metres like Śārdulavikrī lita and Danḍakas, along with the Galitaka and Sarabha, which contain perhaps the earliest specimens of rhyme—a feature which became popular, at the same time indispensable feature in later ages. It will perhaps not be hazardous to guess that the absence of the rhymed and alliterated padas of the pkt stanzas in early centuries are obviously due to the dominating influence of Skt metre which has rarely any rhyme.

Dhruvā verses in Bharata's Nāṭyaśāstra are pkt in form but syllabic in nature. In these we have partly internal rime and partly final rhyme. Dr. S. K. Chatterjee⁴ holds that this particular tendency is sure to develop into final rhyme. This tendency appears to be current in the period 200 B.C.—200A.D.⁵ It is noteworthy to mention here that Dhruvā verses found in Ratnāvalī are Prakritic by nature and form.⁶ Kalidāsa's use of Apabhramśa metres for the Dhruvā verses in Vikromorvaślya⁷ points to the age when the hold of Skt metres on pkt metres have been already slackened.

These findings are further supported by the fact that

Mṛcchakaṭika¹ preserved more syllabic metres than māṭrā metres.

Svayambhū's² collection of illustrative verses for the syllabic metres composed by the pkt poets whom he referred to obviously strengthen our view. Among these, the cases are not rare where internal rhyme have not been employed.³

Of the 206 stanzas quoted by Svayambhū only twenty verses⁴ contain final rhyme which is an important characteristics of pkt poetry. This insignificant number is sure to point out the fact how Skt metres exerted influences on Pkt metres in the early Christian Era.

Upto 12th century classical rigidity has been maintained in both Pkt and Skt. To this classical school of Pkt, belong Svayambhü's work and Virahānka's Vīttajātisamuccaya. It is interesting to note that latter always pays homage to the Skt authority.

Virahānka made provisions for the Skt syllabic metres in Skt languages in his manual. But in the treatment of

these he does not use Aksaraganas in defining them but he sticks to the terms mentioned by him in I. 17-33.

Svayambhücchandas on the other hand set up the chapter wise arrangement after the fashion or Pingala Ch. Sütra unusual in Pkt tradition. In addition, it is also noteworthy that Svayambhücchanda is the only work which made provision for Ardhasama and Visama Vittas in which again, the Skt metre śloka has been treated. Neither vittajāti samuccaya nor Pkt Paingalam paid attention to the aforesaid fact.

Vuttodaya,² the only extant work of pāli prosody has been sketched after the fashion of the Skt authoritative work of its time, i. e., Vṛttaratnākara.

Kavidarpanam directly used syllabic ganas for the Skt syllabic metres and mātrāganas for the pkt metres.

Pkt Paingalam though recognises both types of ganas in the execution of VarnavIttas it employs both the designations along with Pingala's mnemonics⁴ according to convenience.

In the execution of some technicalities the influence of the Skt metres in the pkt versification is discernible in more than one way.

Five matra ganas for Arya metres are no doubt the

- Virahānka, Kavidarpaņam, Pkt Paingalam and Hemacandra's chandonuśāsanam had first preference to Pkt or mātrā metres than to syllabic metres.
- 2. Op. cit. Ch. I P. 84
- Unlike Virahānka, Kavidarpaņam used Pkt language in the treatment of syllabic metres.

invention of the Skt authority. Consequently, restrictions imposed on the use of these ganas must be credited to the Skt prosodians. Virahānka does not adopt Pingala's mnemonics but recognizes the prohibitive rule regarding the use of Jaganas according to the manner laid down by the Skt authority. Pkt Paingalam though used mātrāganas for mātrā metres, recognised the restricted use of the Jagana.

In padmāvatī¹ avoidance of Jagaņa among the eight caturmātrās has been strongly emphasised. The next important characteristic of the Pkt metres is that the syllable employed in it are of flexible nature. From the metrical point of view, the most noteworthy feature that first attracts our notice is that E and O, the relative quantities of which are fixed in the Skt are elastic in the Pkt metrics.² But vṛttajāti Samuccaya is the only work under the spell of Skt which does not recognise this fact. Jānāśrayī a work on Skt and Pkt metrics however does not note down this fact, whereas Hemacandra's Chandonu-sāsanam lays down the fundamental principle of the Pkt metrics to this effect.

The second issue regarding the quantitative character of the syllable in the Pkt metrics is that the short vowel before a conjunct consonant is not always heavy as it is in the Skt tradition. Vjs and Svayambhū does not care for

^{4.} Edotau Pādānte Prakṛte brsvau vā I // 9. cf. Jayakīrti chandonuśāsanam :—1.5. Bhasavisayenyathā Jagadvānyedodau tu guru laghu ca dṛṣṭham. Jayadaman. 1949.

this rule. It is not only Vjs, in the early century, that does not include the rule that 'u', 'hu' and 'ha' when added with 'vindu' would not be long, practised among the Pkt prosodiens, but Svayambhū, Jayakīrti and Hemacandra have also followed it.

In Chandoviciti neither of the two characteristics of the Pkt metrics has been dealt with.³

In some of the process of the Pkt versification the Skt rule and regulations have been executed regularly. These are clearly discernible in some metres of which most important is Gāthā.

(a) Gāthā, one of the oldest Pkt metres is the first mātrāvṛtta that has been remodelled with Skt rigidity and has been employed by Skt pandits for the purpose of their scientific composition.

Pingala conceived of it as consisting of two hemistiches and Jayadeva and Jānāśrayī followed him in the use of the term 'Ardha'. Hemcandra the polymath scholar echoes it.

Again, we may put that the credit of the imposition of ganas in Āryā lies with the Skt prosody. Because, Pingala

- It arāim Jāna lahuakharāi pāantimellasahiāņa samjoapadamadīhara savindusavisaggavannā na // Vjs. 13 // 1. vjs=vrttajātisamuccaya.
- 2. Svayambhū does not accept the elasticity of the lengthening of the vowel before consonant but does recognize the elastic position of the vowel 0 and E, the quality of which is almost fixed. - 8. Lah samudrā gaņah. IV. 12 P. Ch. Sū.

was the innovator of the gana system and the five 'Caturmātric' ganas have been designated after the name of the syllabic ganas.

But Gāthā as a metre of four feet with the distribution of mātrās in the four padas is presumed to exist with the Pkt tradition. The given supposition can be corroborated with ample facts supplied by the extant literature and by some techniques employed by the extant manuals. Illustrative Āryās are not rare where not the gana system as such but only the total number of mātrās have been taken into account. That Gāthā is fourfooted and merely substantiated by the pāda arrangement of two Pkt metres Veralu and Cūḍāmaņi.

These two consist of the pādas of which three of the former represent the pādas of the Dohā and the remaining one the last part of Gāthā and first two of the latter are of Dohā and last two of Gāthā.

Given deliberation is sufficient to show the fact that Aryā arranged by gana system within two hemistiches is purely of Skt origin and the Gāthā with the distribution of the mātrās among the four parts belongs to Pkt tradition. Vjs., supposed to be the work of the early tenth century defined Aryā in a manner of Skt tradition. 4 i.e. in the frame

Remaining are 'Yodha' or signple four matric units.

of gana metre whose subordination to classical authority has been proved in many ways.

Strongly enough Svayambhū avoids the Gāthā metre. But the other works like chandonuśāsanam of Jayakīrti, Gāthā Lakṣaṇa of Nanditādḥya.¹ even the Pkt Paiṇgalam the standard work of the Mediaeval period made provisions for two types of definitions embraced by two traditions.² Of these works, last two in order of preference placed the Pkt definition in the first position, but they appropriate the definition according to Gaṇasystem.

The author of Kavidarpanam places gatha under Catuspadl, though his definition represents the gana regulated Arya consisting of two hemistiches.³

Jayakīrti, the Canarese prosodist⁴ wrote his manual in Skt but deals with kannada metres. That is why two types of definition have been alluded to in his manual.

The polymath Hemacandra has been totally guided by the Skt tradition because in his manual we got Aryā in Skt form.⁵

Again, the broad divisions of Aryā into Gīti, Upagīti, Udgīti and Āryāgīti. have been originated through the conversion of the respective halves.

^{6.} CL....

Pkt tradition confoms faithfully to this method but with new designations such as Udgāthā, Gātho, Vigātho and Skandhaka respectively.

Jayakīrti Ieans more on Skt tradition but selects the Pkt adaptation for the last mentioned metre and in this particular issue Hemacandra follows him faithfully.

So far as this issue is concerned, Virahānka shows his subordination to Skt authority, except in the use of Skandhaka which he treats in the section devoted to the Pkt metre.²

Kavidarpanam³ has been largely influenced by the Skt tradition, though it accepts the designations employed by JayakIrti.

He, however, adds more varieties by adopting the designations laid down by Pkt authority and not the characteristics as have been preserved there...

Gāthālakṣaṇa introduced a new type which was later on appropriated by Pkt Paingalam along with the reversed type viz., the Simhinī.⁵

Gātho Gāthā vigāthe Udgātho Gāthini ca Skandhaśca (Skt version

Chandokośa, a Pkt manual though follows the common tradition or Pkt Paingalam, in many ways appears to have been more influenced by Skt prosody in the selection of Skt designations for Aryā varieties.

In Vaitālīya class of metre, partly syllabic gaņa arrangement can be taken as the function of orthodox authority. Originally it was descriptive Ardhasama mārrā metre having fourteen and sixteen mātrās in each alternative pada as can be proved by the early Pkt literature.

Pingala's manner of defining seems to point out first the total number of matras of meter concerned and then regulated portion⁴ which is perhaps his own imposition. Moreover,

other forms like apātalikā, Udīcyavṛtti² and prācyavṛtti³ originated from the same metre tend to support the assumption that this group of Pkt metres have been formulated in accordance with the regulation of the Skt authority. There are certain metres where the whole of the mātrās have been converted into syllabic forms i.e., instead of matric ones we have these Pkt metres in syllabic form.

Vegavatī, one of the Ardhasama metres from Pingala's age is perhaps born out of Vaitālīya, because, the same has been treated by Virahānka as a Pkt metre finally, it can be said that the Ardhasama metre like puspitāgrā, Viyoginī can be taken as the syllabic forms of Pkt Vaitālīya.

The given specimens grown out of the Pkt metres. Vaitālīya and its group are sufficient to show that Skt prosody exerted influences from the age of Pingala. Lastly, we can place Daudaka class of metre which is supposed to be of the nature of a Pkt metre but being controlled by Skt regulations has been installed among Skt syllabic metre. Following data collected are enough to substantiate our theory given above:—

Hemacandra's comment on the Galitaka speaks in favour of our assumption, where the Dandaka has been read along with Aryā and other Pkt⁷ metres.

Virahātka8 treated it along with other Pkt metres.

Dandākāryādibhyanyacca Sayamakam Galitakemityaka Chandonuśāsanam IV // 2 //- JBBRAS. P. 43. 1943.

Māgahiāmattāņam adhilāraţţāņa dhoruāņam Rāsaasisatialadan laakhanduggaānam ca //

Javakīrti, a southern prosodist1 prefers to include it in Miśrādhikāra chapter where from the syllabic metre has been totally excluded. Oldest recension of Nagavarma's Chandombhudhi² leaves a provision to read Dandaka along with lati metre.

Besides, in Telegu prosodical works Dandakas are treated as Mātrācchandas.8

Vrttamauktikam4 of candrasekhara which is grown out after the fashion of Pkt Paingalam is judicious enough to insert this class into prakīrņaka Prakaraņam.

In Chandopiyūşa, Daudaka class has been placed just before the commencement of the Matra metre."

From the foregoing discussion, it becomes obvious that the Dandaka class, the longest metre dealt with in Pingala chandah sūtra, seemed to be Pkt by nature but has been adopted with some regulative methods by the Skt authority.

The far reaching influence of Skt prosody can be guessed. The syllabic metres have been treated like matra metres, in other words, the syllabic metres intruded the field of Pkt metres on account of their very syllabic arrangement.

The following peculiar forms are specially noteworthy in this connection. Most of them are basically matric but there are some restrictions imposed on them.

Raktā¹ is a metre of such a group with extended form as Mānin¹,² bearing different designation like kheṭaka³ appearing in the other part of the manual. This can be called practically a varūa metre diminutive form of Piṅgala's Samān¹,² but Pkt Paingala's Samānikā,⁵ Bharata's Kāmini,⁶ Jayak¹rti's Gomin¹ and Hemacandra's Uṣūlha.⁶ Same is the case with the Haṁsin¹⁰ which is Hemacandra's Anuṣṭup. Much known pramāṇikā is appropriated as Nārācika.¹º Nandin¹¹¹ treated two times among Pkt and Apabhraṁśa metres in Virahāṅka's manual practically is the same as Skt Toṭıka.¹² Likewise, Bhramarāvall¹³ having one more Sagana than the previous one placed among the Pkt metres, has been treated as a syllabic one in Pkt paiṅgalam.¹⁴

Bhittaka¹⁵ is exactly Dodhakam¹⁶ and parinanditā¹⁷ is the same as Svāgatā. Vibhuşana of Virahānka¹⁸ is an Apabhramsa metre but in the Mandāramaranda campū¹⁹ it is syllabic.

In Gatha (neither Arya nor Gatha)¹ can also be found fixed syllabic arrangement. Megah and Vibhramah are syllabic in form but because of their extensive use in Apabhramsa literature they are treated among Apabhramsa metre.²

Similarly, Aśvagati³ has been appropriated by a host of writers as syllabic because of its fixed syllabic arrangement, but the inherent nature of it as Pkt metre can never be doubted. The scheme of the said specimen suits the vein of the Pkt rhythm since it forms a part of strophimetre.⁴ Incidentally can be referred to another strophic metre whose initial portion has got a fixed syllabic form.⁵

Besides, there are some pure Pkt metres which have been likewise, imposed with syllabic restrictions in particular position. Velankar⁶ differentiates them from pure mātrā vrttas, as there exist many restrictions regarding the employed letters which the pure mātrā vrttas did not require. Among them there are Dvipadī types such as Khañjas, Sikhās, Mālā. Coming next to them is catu-spadī like Bahula¹⁰ which contains nine mātrās or three Na gaņas. Wholly regulated are Somakāntā. Dumila¹² and

Mehanī¹ which are the Pkt version of Skt Vidyunmālā. As metres of Catuṣpadī partly regulated are Madhubhāra² with eight mātrās of which second must be jagaņa (ISI), Ābhīra³ with eleven mātrās is to be represented by a jagaņa (ISI) at the last four.

On the contrary, Adila4 and Madila5 metres of 16 mātrās must not contain Jagaņa (ISI) but the last two mātrās of the last gaņa must be represented by two shorts. Simhavoloka6 consisting of four Caturmātrās must have either na (IIII) or sa (IIS).

Mātrāsamaka group of metre consisting of sixteen mātrās received a full fledged restrictions regarding the application of the syllables. These metres having been regulated by the Skt authority receive additional restrictions which are not sanctioned by the Pkt manuals. Yet the reimposition of the rule and restrictions is undoubtedly the reactionary effect of the Skt authority. In Skt manual the 9th and the last syllables have been regulated i.e., the 9th and the last must be short and long respectively. But in Pkt manual this got an additional binding i.e., there must not be ja (ISI) in this metre.

Pādākulakam⁹ as specimen of Mātrāsamakām type is purely a hybrid mātrā whose pada of sixteen mātrās are of

different characters. These different forms are no less: than four in numbers and constitute the independent metres in Skt manual.

Pajjhatikā² is simply a metre of four mātric ganas in the early Pkt manuals, preceding Pkt Paingalam, which under the grib of Skt influence imposes restriction on the free use of Jagana.³ And this metre which in early Skt manual got no place, appeared in later manuals in a new form.⁴

Saveyā and Ghanakṣarī⁵ two metres appeared in the late century manuals are syllabic in form. Among them again, the former is regulated by syllabic gauas. These very two made their first appearance in both the chapters of Vīttamauktikam, dealt with mātrā metres and with syllabic metres, particular syllabic arrangement of these two metres influenced the Pkt versifiers so much, that they have been appropriated in their manuals. Twenty one syllabic.

Mandirā is a Pkt metre in Vjs.¹ These are the favourite metres of the vernacular languages like Marathi, Hindi and others. These metres, not only have been included in the manuals but have also been used extensively in literary compositions.

From the deliberations made above, it can be safely concluded that Skt authority exerted a dominating influence through the ages on the contemporaneous Pkt prosody. In the early centuries of Christian era it was acute and responsive. But with the passage of the time and with the advancement of Pkt culture, the classical influence has gradually been shaken off.

We have seen that Pkt under consideration occupied the middle stages in the history of Indo-Aryan languages and our present concern is to dilate on the existing prosodical principle of the last stage designated as Tertiary stage² of Indo-Aryan. A clear idea of these prosodical principles is to be had from the oldest extant specimens preserved in the various colloquial Indo-Aryan or CIA in which they are fully established. On the theoretical side, a very few manual for the guidance of the versification can be found. Until nineteenth century we have practically no work for the versification specially in Bengali, Hindi and Gujrati. Marathi however can claim to have advanced much earlier than its sister languages.

In Chandombhudhi, the only available Canarese work, the influence of Skt prosody is clearly discernible. Flourished in the early mediaeval period just before Hemacandra,

III. 34. Vjs. cf. Saptabhakāragurupahitam vahubhih kavibhih vahudhā kathitam—iyameva asmābhih mātrāprastāre pūrvakhande saveyaprakarane madirābhidhā saveyā ityuktāsīt. Tatoevavadhāraniyā. Vr. Maukt. Fol. 102a.

Tartiary stage of Indo-Aryan - Dr. S. K. Chatterjee.

^{3.} Ed. Kittel. 1875.

Nāgavarmā's prosody has grown out after the fashion of the Skt prosody. Pingala was acknowledged as the propagator of Chandosastra.¹

In the execution of technical principles Chandombhudhi dictated more classical rigidity than the other Pkt works. In it there is a treatment of Skt mnemonics along with the Canarese figurative names. Skt Ardhasama and Vişama metres have been given due place after Sarvasama Vittas. Not only that, we find no optional rule regarding the lengthening of the short vowel before conjunct consonant. Besides, we can see Canarese composition in Epigraphy² used a number of syllabic metres from the early centuries.

The earliest direct evidence from the vernacular side is unfortunately very late and so far as Bengali is concerned, we have documents which undoubtedly go back to a date prior to 1200 A.D when the Siddhyācārya composed the Dohā.

In these Dohā or poetical compositions classical rules of quantitative method has been fully applied, or in other words, in it orthographic quantity has been restored.

In the age preceding it we have the literature with the religious theme written mostly in fourteen syllabled Payār. According to some authors, the origin of the Payār is to be sought in Anuştubh by the elision of two syllables according to pure moric system.

^{1.} Verse 22. Kittel's edition. P. 6.

^{3.} Ucā ucā pavala tamhim vasaī savarī valī/Maranga pīccha parabina savarī, givata gunjarī malī/Caryāpada. P. 19. Manindra M. Bose. It is the first stage of Tripadī type of Bengali verse. One can compare it with the Şatpadijāti of Pkt versifiers, which however supplied only Skt verse. In Śrīkṛṣṇa Kīrtana this type of Tripadī can be found: "Ācāryakahen vāṇī hao tumi mahājñānī Viṣṇubhakti tomāte prakāś/Dekhiyā Gotami Tantra dehato yugala mantra Sei mantre āmār viśwās.//"

^{4.} Pure moric system or Khānţi mātrik nīti in which all syllables

In the stage of Proto Bengali, the quantitative method of versification is mostly followed. But in Pure Bengali, prosodical principles are radically different from those in classical, as it has been always based on the accustomed modes of reading and elasticity of pronunciation. But since the 18th century persistent efforts have been made by the renowned authors like Madhusūdana Tarkālankār, Bharatcandra etc. down to Dilip Roy of our days, to superimpose the quantitative methods on Bengali language. But their attempts were at best "tours de force and their scope was exceedingly limited"—as has been remarked by Dr. A. D. Mukherjee. 1

Yet the orthodox minds have been successful in finding out the methods of picking up such Skt metres as are compatible with elasticity of Bengali pronunciation.

This method has been adversely criticised by Rabindranath Tagore who thinks this effort has ultimately resulted in producing a frolic sarcastic poem.² As for illustration we may cite the effort to set the Bengali verse in the frames of classical Anuştubh.³

Versification in Bengali in the model of Skt poetry has

must not possess mātrā or morā. The term 'Kothāy' acc. to this principle contains only two mātrās—P. Ch. Bagchi P. 855. Bhārat Varsa. 1341. Agrahāyaņa.

been attempted on experimental basis since 18th centurythrough different methods which may be summed up asfollows:—

1) The orthographic value of the vowel has been restored faithfully.

The rhythm of the Skt metre has been restored through the counting of syllabic sounds.

3) Adopting the purely vernacular method in which the total count of mātrā is of main concern and where the conjunct consonant has been reckoned to have two mātrās and simple ones only one.

4) The last two methods were integrated with a view to producing the desired effect.

Bharatcandra, Vijayacandra, Haragovindalaskar Chowdhury, even Dilipkumar are the pioneers in the lineto experiment the first method.¹

The second method to some extent follows the Vedic principle² in which the syllables, irrespective or quantity are of prime concern.

Mālinī—15 syllable. 8—7. cf. Skt definition:— NaNaMaYa Yuteyam Mālinī Bhogīlokaiḥ. Kothāy āji gela ude / 8 Bulbuli se nāi go naī / 7 Phurāye yāy phāgun yere / 8 Tarun jīvan vṛthāi bhāi / 7

The next method is experimented to introduce the Skt spirit in new rhythm through the Bengali artifice of versification. Satyendranath's regulated Svaramātric process is no less unsuccessful in introducing the combined method of the second and the third. Irregular Svaramātric system introduced by the same poet was able to retain the Skt rhythm in Bengali versification. On the other side, practically only a few number of manuals exist in Bengali. But the most interesting fact that is worthy of mentioning here is that all these works are written on the model of Skt Chandasūtra. The earliest available work is Chandasamudram written by Vaiṣṇava Śrīmatnarahari who had utilised most of the works on Skt prosody. No wonder that the author would pay tribute to Pingalācārya.

In the 19th century Bhuvan Mohan Raychowdhury⁴ composed a manual in Bengali for the Bengali language in which Skt versification has been taken as the source. In this manual, not only the Skt tradition has been followed, the Persian metres most probably circulated at the time were treated as Skt ones.⁵

Udiyā geche se bulbul śunya piñjar hethāy bāy

Chandomālā of Madhusūdana Vācaspati allotted seventyfive Skt and Bengali metres in his short manual ¹

In Gujrati attempts have been made from the middle of the 19th century to write useful handbook on prosody blending the old and new flourishment. Raṇa ringala² of Late Dewān Bhadur Rāmchanbhai Udayarām is an exhaustive treatise dealt with Gujrati prosody which recognised the authority of Pingala. For a passing reference we can place Brhat Pingala which not only recognised the promulgator of Chandaśāstra but also made provision for the analysis of new Vṛttametres evolved in Skt and Gujrati poetry.

A bird's eye view of the plan and procedure of the extant works on Hindi prosody will always show that the influence of Skt prosody left an inefficable impressions on these works. In most of the works, the author of the Vedāngachandassūtra has been paid homage to as the promulgator of the Chandah.

Chandārņava⁴ Pingala of Bhikhāri Dās is an erudite work on Hindi metrics in which all metres have been treated from the angle of Mātrāmetres. To simplify it, can be said that Varņa metre has been dealt with as mātrāmetre, for example-Vidyūnmālā has been given place in the group of sixteen mātrās along with Dodhakaṃ.⁵

Tulsidāsa in order to make his work complete without any obstacle, used the syllabic metre commencing with magana. That is why each canto of his Rāmacaritamānas begins with Skt verse containing metre whose first syllabic combination is made with 'Magana'. Bhikhāri Dās among the mātrāmetres, retained Dandaka in its syllabic character.

Chandopradīpa of Jagadīsabhatta Sāstrī is a manual grown out in its own way, but it deserves to be mentioned for the compilation of Skt metres used in Hindi literature by a host of poets which he utilised for illustrative purpose.

Chandomañjarl of Gadādharakavi is moulded in its different aspects after the fashion of Chandomañjarl of Gañgādāsa but not totally. It deals with different types of syllabic metres, but most noteworthy peculiarity of its treatment is the inclusion of Upajāti metres among Mātrā Vṛttas. The term Upajāti literally means that which bears affinity to Jāti. Perhaps this implication has been arisen in connection with Jāti metres as has been hinted at by Jānāśrayl on many occasions. Perhaps this authority has in mind, that as in Jāti metre so in hybriol type syllabic position is not

necessarily of primal concern. That is why, the latter has been so called.

Chadoprabhākara of Jagannātha Prasāda, though a complete work on Hindi prosody comprises like Monahara, Jalaharana, Devaghanaksarī, Vijaya, but sometimes expression looks like the very recast of Chandomañjari.1

Haradeva Dāsa in his Chandopayanidhi, though mainly concerns' with matragana of Pkt metres and dialects on the principle of vernacular prosody2 lends provision in the concluding chapter for syllabic metres expressed through the syllabic ganas.3

Incidentally, we may also refer here to Chandomālā, the earliest extant work on Hindi prosody placed the syllabic metres in the premier chapter treating it exhaustively4 but the second chapter deals only with the twenty-six matra metres.

Through the ages, the Hindi poets could not despise the Skt metres. In the early ages of Vidyapati and Canda, we met with Śātaka (Śārdulavikrīdita), Śloka, Bhujangaprayāta etc. In the middle ages, in Ramacandrika of Kesava, a considerable number of Skt metres have been made employed. In the modern ages, in the works of Mahāvīraprasāda Dvivedī, in those of the state poet Maithilisarana Gupta. use of the Skt syllabic metres in large scale speaks of its unavoidable influence on Pkt prosody.

Before we close our discussion, we would not be superfluous for sparing a few lines for the literature other than Skt beyond India, which is the strictest sense could not be termed as Pkt, but as non-Skt it can be comprised within our scope. In the following paragraph, we would show the reactionary influence of Skt prosody.

Mr. Gonda did not exaggerate in saying that so long as Hinduism overseas was a vital force, the Indian emigrants continued in bringing a mixture of various elements of Indian culture into their new abode. Such countries are Malaya, Javanese and Balinese which from the cradle to grave are surrounded by the survivals of the Skt culture whose contribution mainly lies in sphere of loan words, rhetcric and prosody.

Poets of ancient Java used Skt metres with remarkable efficiency and almost all the metres known to Skt prosody have been used in poetical composition known to 'Kākāvin' and 'Lāmbung' of which the latter only has reference in Sutsama.

In the 'Arjuna Wiwāha'³ we can find Śārdulavikrīḍita, 'Vasantatilakaṃ, Śikhariṇī, Sragdharā, Praharṣiṇī, Rucirā, Taţoka, varieties of Dhṛtis, Kṛti and other types of metres.

In many chapters, strophies made of Aupacchandasika, 'Upendravajrā and Mattamayūra have been found. In some mss of Javanese 'Ojar' poems, the name of metre has been mentioned at the head of the cantos however in slightly corrupted forms—'prawiralalita' instead of (pravaralalita); 'basanta' instead of 'Vasantalilaka', 'Šikarinī' instead of 'Šikharinī', 'bamšipatra' for 'Vamša' and so on.

In a Balinese piece, the metres employed in the Nagara-

Krtagam of XIVth century, metres such as Sardula (Skt. Śārdulavikrīdita) Mandākrāntā (Skt Mandākrantā) Śikarinī (Skt Sikharini) have been found to exist.

Many Indian metres and Indonesian variants were used by Kawi poets.

As a Skt equivalent the term 'Virāma' we find 'wirama' which however signifies 'singing in time', a word for 'measure' a sound, because in Javanese 'irama' measure'

No less interesting is the fact that the term siloka having its Skt equivalent Sloka. has been preserved in Sudanese which signifies 'Apothegus', metaphorical sayings especially dealing with religious topics

The term pada as the fourth part of a stanza has been preserved in Javanese as well as Sudanese in the sense of a stanza as well as punctuation mark or stop between the two lines of a stanza

Finally it is interesting to place here the theoretical works now available to us.

'Vittasaficaya' a work on Javanese prosody offers an exposition of Vrttas alone. The work is attributed to 'Tanakun' an well-known author of 'ojar' poems and seemed to have flourished in the year 1200 A. D.1

The author being an expert in his line, pays his homage to a variety of sources such as Ramasarman (St. 4) Pingala (St. 7) and Pingala Sästra (St. 109)

Fragments of other texts have been found in manuscript, dealing with metrics such as Vrttavana? in which can also be found Skt metres like Vrşabhagativilasita, "Manigunanikara and other metrical forms.

The remark that 'Skt metres have not much affected Malayalam metres although poetry in Malayalam has been written in Skt metres¹—proved to be inconsistent in its meaning when we find some fundamental principles in which both the languages bear much affinity. Like Sanskrit prosody. Malayalam prosody is quantitative by nature. In general, short and long vowels contain one and two mātrās respectively. A short vowel followed by the conjunct consonant had the value of a long.

In spite of that, as a poetical licence, a short syllable can at any time be treated as long. But the case of shortening the long is very restricted but not altogether nil. The only place where Malayalam prosody differs from that of Skt is in the use of units like ganas. Arrangement of the units is also radically different. 'Keka'. a metre of 14 syllables will be arranged in equal halves, each of which again would be made into sub-units containing syllables three, two and two.

Otherwise, Malayalam is the recast of Skt without following this type of arrangement. 'Kakali' metre in Malayalam is nothing but the Skt 'Vamsastham'. The favourite metre 'Keka' can produce the rhythm of much favourite Skt 'Vasantatilakam'.²

II. THE INFLUENCE OF PKT METRES ON SKT METRES

The influence of Pkt metres on Skt metres can be estimated through literature in which the Pkt metres are found to be exclusively used and through manuals in which the techniques relating to Skt prosody show visible influence of the Pkt prosody on them.

We had seen in the previous chapter that subsequent to the Brahmanical literature, the literature of Jainas and of Buddhists flourished in ancient India being enshrined in Pkt languages.

We have also seen before that the earliest among them are composed in syllabic metres mostly in Anuştubh, gradually yielding place to the mātrā metres in the form of Gāthā, Vaitālīya and Mātrāsamakam. These three metres predominates in the literature of the period preceding the classical one. But Skt poets of the early centuries made extensive use of them. Sāṅkhyakārikā of Iśvarakṛṣṇa¹ is a composition of seventy-two Āryās or Gāthās. In Epic one can very rarely find out this metre. There are abundant use of Vaitālīya in Sanskritized³ form, because all the Ardhasamakam metres like Puṣpitāgrā, Viyoginī, Mālabhāriṇī are the recast of the original mātrā metres.

Gītikā metres consisting of pure five Miśragaņas³ of Canarese prosody are found extensively employed in the

^{1.} Kss. 123.

^{2.} cf. Jacobi. ZDMG, XXXVIII. 1884.

^{3.} The miśraganas are those which consist of 15-17 mātrās confined to 9 to 12 akṣaras. These are known as Süryagana, Indragana, Candragana to Telugu prosodians and Brahmagana, Viṣṇugana and Rudragana to Kannada prosody.

Skt inscriptions¹ even in the 5th century A.D. when the sway o: Skt metre is in tull swing. Rāvanārjunīya, a Skt composition contains some verses in which the same miśragaņas have been employed.

Number of Skt and Pkt metres in Somasūris Yaśatilaka Campū² using end rime and mid rime explains the same fact. Virahānkas, solitary illustrations of the metre Saumyā³ in Skt language, though treated among the Pkt metres, indicates the fact that even Pkt and Apabhramśa metres have been favourably accepted by Skt poets. The same can be said for the metres like Upadohaka and Upajāti appropriated by Svayambhū, who made provisions for them in the Skt illustrative verses perhaps for their use in the Skt literature. A Because, in the treatment of syllabic metre, he did never place illustration from Skt literature. Kşemendra's Daśāvatāracaritam⁵ is composed in the Upajāti

metre. Jayadeva1 too in his lyric used this.

Hemacandra² in his treatment of Dohaka, a variety of the first type, laid that the metre has got frequent use in Skt compositions.

The popularity of the matra metre among the Skt poets even before the time of Hemacandra can be testified by the number of excerpts collected from Skt literature used for illustrating Apabhramsa metres.³

In addition, we have a number of instances which unmistakably evince the popularity of Pkt metres, which from time to time enchanted the orthodox writers.

Mankha almost in the same century experimented famous Apabhramsa metre Dohā⁴ in his Śrīkanthacarita and Bālacandrasūrī in Vasantavilāsa Kāvya appropriated Mālādhruvaka⁵ and Vidyādharahāsa⁶ along with Gīti and Pādākulakam metre. Gīti Āryā of Skt manuals is a Mātrāvṛtta with sixteen shorts.⁷ But as it has got a fixed syllabic arrangement, Svayambhū treats it among syllabic metres and Śrī Harsa too accepts it in that form and employs it among Skt metres in his Naisadhaīyacaritam.⁸

Pkt metres with rhymed and alliterative padas are

successfully appropriated by the Vaisnavas¹ in their literature. Gltagovinda is the most probably one of the earliest examples of such an attempt. Virūḍakāvyas of the Gauḍīya Vaiṣṇavas with their musical chants resonant with the alliteration and other novel devices vernacularise the Skt verses. Phāgustava of Gujrata poets² present a novel artistic composition on account of its superbly mellitluous metrical pattern of the phāgu for its religious panegyric.

Just in the early Christian period, Gāthā verses in Buddhist hybrid Skt language tried to imitate Sanskrit in every respect.³ Mediaeval Jaina writers mostly in the region where Gujrati and Rajasthani are in vogue, Skt compositions too imbibe the vernacular spirit in every raspect. It is aptly termed as vernacular Skt by Dr. Hertel as it typifies a litetary medium in which Skt took the rhythm of the vernacular. In these works common Skt verses are made musical by effective middle rhymes so familiar to vernacular verse.⁴

navajaladhara varaam Campkodbhāsi Karņam Vikasiti natināsyam visphūram maņda hāsyam, Mukunda Muktāvalī: Specimen found in New Indian Antiquary Vol. (metre Mālinī). P. 159. 1947.

^{2.} Śrī Mahāvīrastavana Phāgu Bandhas.

Thus we have Sanskrit stanzas with Phāgu (Dohā 13+11 with internal rhyme.) Adhaiya (11-11; 10-10) interchanged with Skt Varņa metres and closed with Gītikā metres.
In Gujrati, Phāgu poem is of lyric type which deals with description of Vernal splendour and its impact on love lorn youngs. Generally, it contains strophes of two Dohā metres being added with internal rhyme which links the end of the first pada to the beginning of the 2nd pada. As it is suited to the composition, it became known as Phāgu metre. Later, Dohā has been replaced by Rolā metre.

Side by side pure mātrā metres like Utfullaka, Utsāha² etc. are extensively used in the Vaiṣṇava Kāvyas as well as in other Stotrakāvyas most of which passed under the name of Vedantist Śańkarācārya.³

From the discussion made above we can have a clear idea of the influence of Pkt metres on their Skt counterpart through the ages.

Finally, before closing our discussion, we can place the case of the Orthodox Rhetorician Jagannātha. As an orthodox alamkārika Jagannātha despises verbal artifice but as a literal prosodian he does not find it unjustified in employing amphibrachic in odd pada⁴ which appears to be distilled by the Skt tradition. He also employed Pkt metre like Ghattā having twelve mātrās in each foot of quadruped stanza.⁵ This is obviously an evidence of the Pkt influence on Pkt works belonging to the late period.

Just before the advent of Pkt Paingalam most of the manuals on Indian metrics have been more or less nourished by the Skt tradition. But subsequently it appears that Skt

manuals were attracted to the Pkt tradition and generally followed the path chalked out by the Pkt Paingalam.

In the execution of plan and procedure Vittamauktikam¹ of Candrasekhara, Vāṇībhūṣaṇa of Dāmodara Miśra,² Vāgvallabha of Duḥkhabhañjanakavi³ adopted the method laid down by the Pkt Paingalam.

Early Skt manuals know only four matric gatas prescribed by Pingalācārya. But the late century manuals after Pkt Paingalam incorporate the matraganas beginning from two matras introduced by Hemacandra for the Pkt and Apabhramsa metres. Classical maxims in some of these cases lose their rigidity due to their contact with Pkt maxims.

The generally accepted rule that the short preceding a conjunct consonant would be considered as heavy has been accepted by Pāṇini⁵ and the same rule has been incorporated by Piṇgala.⁶ This has been faithfully granted by the orthodox prosodist⁷ and Jayakīrti, side by side with the classical maxim, lays down the optional rule accepted by

Pkt manuals.1

In the orthodox school Kedārabhaţţa was perhaps the first writer to speak of the optional rule concerning the lengthening of a vowel preceding a conjunct consonant.² Hemacandra being³ a Pkt prosodist does not make provision for this optional rule, though in his manual orthographic character of the syllable is not rigidly preserved.⁴

Subsequently this rule in its modified form seems to have been generally accepted by Skt doctrinarians⁵ and this phenomenon is perhaps the most convincing evidence to whom the Pkt prosody exerted its influence directly on Skt prosody.

In the previous section, it has been admitted that Aryā in a hemistich as a gana metre is purely a Skt innovation, whereas the credit to describe it as a quadruped with total

count of matras in their respective padas will be given solely to Pkt. tradition.

In this respect Jayakīrti's manual also follows both the traditions. The same is the case with the Pkt Paingalam, only with the difference that while Jayakīrti gives first preference to the Skt tradition, the latter gives preference to that of the Pkt and it is probably due to the fact that in spirit the former is more Skt whereas the latter is more Pkt.

And all the Skt manuals succeeding the Pkt Paingalam incorporate in their manuals the four footed Gāthā. But there are some who include both the type which are composed obviously in an atmosphere in which fusion between the Skt and Pkt traditions came to be recognized as a normal state of affairs. Among them Vittamauktikam treats two types of definitions and clearly discriminates Gāthā against Āryā by formulating rule to scan by the total count of mātrās,2

Chandomañjarl however, dissociates itself from tradition so far as this particular issue is concerned, whereas Chandomrtalata, a verbatim reproduction of it could not detach itself from the influence of Pkt.

Rime and alliteration which are the concommitant elements proved to be necessary for the definitions of the Pkt metres in Pkt manuals. These are found to be applied in the definitions in the Skt manual. For an example, in Pajjhaṭikā chandaḥ, Pkt Paiṅgalam prescribes neither rime nor alliteration, but when defined in the late century Skt prosodical works like Chandomañjarī and others, it has been equipped with rhyme.²

Finally, we can have definite traces of the influence of Pkt prosody on Skt one, when the appropriation of Pkt metres has been made in Skt manuals. This process has been carried on directly and indirectly.

Pkt and Apabhramsa metres, such as Galitaka, Dohā, Rolā, Sorattha etc. are found to be adopted in their very form in Skt manuals following the orthodox period. They are totally absent in the orthodox manuals. In this case when the appropriation has been made directly, we would call the influence is direct, because by doing so, the restricted garb of the Skt manual has been made expanded.

When the orthodox spirit of Skt manual does not allow the Pkt metres in their very form to intrude in their manuals but could not despise them due to the direct contact with Pkt literature. It lends places to some metres after orienting or modifying their forms. By this indirect method, the far-reaching influence of the Pkt metres augment the restricted zone of the Skt metres. In the orthodox or first stage, Jānāśrayī is the first manual to include in its limited scope not less than 19 Pkt³ metres of which nearly 11 are

strophi by character.

Ratnamañjuṣā¹ treats Galitaka as a specimen of Ardhasa-mavṛtta metre including it in the chapter dealt with Aryā and its variety. The same one has been treated in Jānāśrayī along with the Jāti metre current among the people.

Besides, two mātrā metres Nīttagati² and Naţacaranam,³ a sub-variety of mātrāsamaka group has been appropriated by Ratnamañjuṣā and Hemacandra as Skt metres but Skt manuals do not recognize them.

Jānāśrayī's treatment of Pañcamātrā group and Ratnamañjuṣā's application of common techniques for both Skt and Pkt metres in their respective manuals when the Skt orthodox influence is in full sway, reflect nothing but a genuine attempt to present a bird's eye view of the influence of Pkt metres on Skt ones, when the classical Skt metres became stagnant in spirit and the Pkt metres supplied opportunities for experimenting and evolving the stable patterns.

In the Skt prosodical works following Pkt Paingalam, Apabhramsa metres have been placed among other matra metres, just as in the manuals preceding Pkt Paingalam we see a fair treatment of Pkt metres.

Among the so called Apabhramsa metres⁴ extensively used are Rolā, Dohā, Mātrā, Kuṇḍalika, Şaṭpadī, Plavangam etc.

Some Pkt metres are modelled after syllabic gavas instead of mātrāgavas. Madhubhāra a metre of eight mātrās

is defined in Vānībhūşanam through syllabic ganas, whereas the same has been treated as purely matra metre? in Pkt Paingalam. It is not surprising when Vani Bhusanam, the Skt reproduction of Pkt Paingalam had given proper places for matra metres like Harigita, Tribhangi, Hiram, Janaharanam, Marattha etc. as pure apabhramsa metres. But one will be really confounded to see that Skt manuals like-Chandahkaustuva, Vrttaratnāvalī, Chandonuśāsanam of Gadhādharakavi and Vāgvallave of Duhkharañjana Kavi made a comprehensive treatment of Pkt metres. Needless to say all these metres treated have been equipped with the rhymed padas, though in the early manuals3 we find in many of the cases the absence of that artifice.

Some Pkt metres possessed a fixed syllabic arrangement and intruded into Skt manuals.

Vibhūsana is a Pkt metre of the type just described defined in Vis.4 but has been treated as Varnavitta in the same manual, as Kanakamañjarī in Mandaramaranda Campū5 and Indira in Chandahmañjarī.6 Aśvakrāntā, an Apabhramsa metre in? Vjs. appears as Varnavrtta in Pkt Paingalam⁸ and in other manuals. Sāngata⁹ becomes Mandira in Hemacandra and Svayambhū10 and Latāku-

suma 10 in Jayak Irti. This got an appropriate implication in the Gopikāg Ita of Śrīmad bhāgavata 1 and Prof. Bhatta-charya 2 has pointed out the Prakritic element in this pattern, in which any student of Bengali metrics would find the rhythm of the well-known song of Kaviguru Ravindranath—'alake kusuma nā dio šithila kavarī bāndhio'.

Ardhasamavṛttas, specially of Akhyānakī and the Viparitā owe their existence to the Pkt metres. In Pingala's computation they are not more than two and gradually swelled upto Jānāśrayichandoviciti to fourteen and two dozens in Jayakīrtis. And incidentally Prof. Bhattacharya had made a noble attempt to show the origin of some of these Ardhasama metres, like Viyoginī, Aparavaktra Aupacchandasika and Puṣpitāgrā to be found traceable to Pkt Āryā where the gaṇa system has not been fully applied. The specimen placed for illustration also shows the amphibrachyics in odd pada which the Pkt Āryā does not care for. More far-reaching influence can be noticed when each pada specimen of Ardhasama metres appears in the chapters of the Sarvasama metres as a single and complete metres.

Sopadhi Saṁdhiduşanāni in which 6—7 gaņas have been merged into
gaṇa of eight mātrās.

^{2.} cf. Our Heritage—P. 52. Ibid. It may be that either of these varieties were more congenial to Pkt metrics?

CC-0. Jangamwadi Math Collection. Digitized by eGangotri

Thus the metres² sa saja ga ga from Viyogin¹; na ja ja raga³ from Aparavaktra, are originated from these Ardhasama metres which were originally Pkt metres.

Ekarūpa a metre included in some of the Ms. of P. Ch. Sūtra (ASB).
 Sa Sa Ja Ga Ga is also designated as Ekarūpa as syllable metre.

Suvaktra in H. II. 195; Acala in Jk. II. 160.
 Bhadrikā. Jd. VI. 26; H. II. 143.
 Bharata designates it as Aparavaktra in the Dhruvā chapter XXXII.
 243. 216. Gos. 145. KSS. 60.

CONCLUSION

The foregoing attempt seems to be able to indicate the diversity as well as immensity of literature of Sanskrit metrics comprising the Vedic ones.

The system having its crude origin in the hoary past of the holy scriptures, is continuing its evolutionary process till the present time. This process of evolution runs through a continuous stream that covers a period of about two-thousand years which is marked by some well defined phases—each of which is dominated by some authoritative works. Among the works belonging to this category Pingala Cchandahsütra presents us for the first time a distinct land mark in its chronology as well as history. In this study, endeavours have been made to establish the mutual relationship of this system to others flourishing side by side, which furnish the best and safest criteria for the orientation of divergent thoughts and tendencies enshrined in the non-Sanskrit works on metrics.

Obviously, the object of this work is fulfilled while it has become able not only to work up and rationalise into a synthetic and comprehensive system, the accumulated observations of the previous thinkers, but is able also to establish the relative chronology of the works on someworkable basis.

Finally, it must be stressed that at the present state of our knowledge this kind of work cannot be perfect or complete. This is rather a pioneer work which is expected to be a guide to the workers in this field in future when we shall have the chance to grow wiser with the discovery of more materials on this subject.
